SERVICE MANUAL

1:4 ISAT

Issue 1995

Preface

The **ISAT** scan tool—The Intelligent SAab Tester is a test and diagnostics instrument designed for fault diagnosis in the car. The ISAT scan tool can be continuously upgraded with new software to deal with fault diagnosis on new models and when modifications are made to the car's electronics.

This service manual replaces Service Informations:
101-1100
101-1347
101-1308

Current information about ISAT scan tool developments will be continuously sent to the workshops affected.

All information and illustrations in this workshop manual are based on information and data which is correct at the time of going to press. Technical data and equipment may be changed without prior notice.

RECYCABLE PAPER

Warning, Important and Note

The headings "Warning", "Important" and "Note" occur from time to time in the Service Manual. They are used to draw the attention of the reader to information of special interest and seriousness. The importance of the information is indicated by the three different headings and the difference between them is explained below.

⚠ WARNING

Warns of the risk of material damage and grave injury to mechanics and the driver, as well as serious damage to the car.

Important

Points out the risk of minor damage to the car and also warns the mechanic of difficulties and time-wasting mistakes.

Note

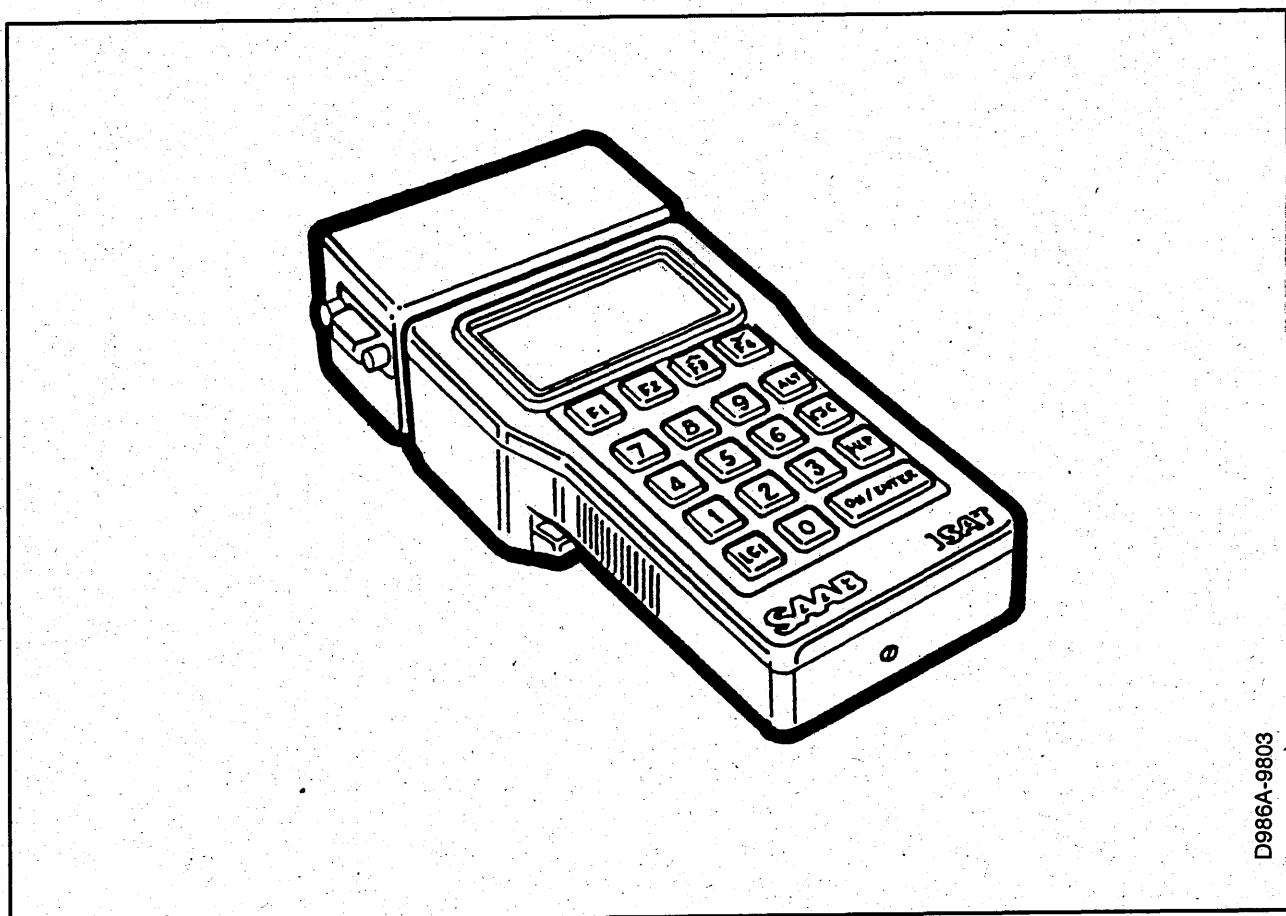

Hints and tips on how the work can be done in a way that saves time and labour. This information is not supplied for reasons of safety.

Market codes

The codes refer to market specifications

Introduction

General

The ISAT scan tool – Intelligent SAab Tester, is a test and diagnostics instrument, designed for great flexibility and to be used for a wide range of functions in the car's electronics system.

The ISAT scan tool is principally for troubleshooting electronic systems which are constructed with self-diagnosis. In this type of system faults are detected and stored in the system's control module (ECM). The ISAT scan tool is used to read the system's stored fault information and the fault is presented in the form of a diagnostic trouble code with text showing the source and cause of the fault. Using the ISAT scan tool the selected system can be checked using the read and activate commands. Control modules can be adjusted and programmed.

There is a description of the fault diagnosis routines for the chosen system in the appropriate service manual.

The usefulness of the ISAT scan tool in other diagnostic work can be increased by connecting external sensors such as temperature and pressure sensors.

The ISAT scan tool can also be used as a multimeter if no dedicated instrument is available. The multimeter can read voltage, current, resistance, pulse ratio and pulse length as well as frequency.

Additional modules which can be connected to the ISAT scan tool provide an increased range of features. The TSI – Timing Service Instrument makes it possible to set the ignition timing. Using the SIM – SAAB Interface Module, it is possible to take readings from the control module pins, both automatically and manually. In addition, readings normally taken using a BOB – Break Out Box can be taken using the ISAT-SIM.

The SDA II – SAAB Diagnostic Adapter is a connecting module which should generally be fitted to the ISAT scan tool in order to ensure correct communication with the car's data link connector.

2 Introduction

This document is a technical report on the development of a software system for the management of a fleet of autonomous vehicles. The system is designed to handle the complex tasks of navigation, planning, and control of multiple vehicles in real-time. The report provides an overview of the system's architecture, key components, and performance metrics. It also includes a detailed analysis of the challenges faced during the development process and the solutions implemented to overcome them. The report concludes with a summary of the system's capabilities and future research directions.

Technical data

Operation

Internal battery, rechargeable	Volts	9
External	Volts	12

TSI readings

Ignition advance	degrees	all
Dwell angle	degrees	all
Engine speed	rpm	all

Technical description

ISAT scan tool basic version	5	Summary of combinations	9
ISAT/ISAT II scan tool with SDA II	6	Accessories	10
Connector, ISAT scan tool with SDA II	7	Using the ISAT scan tool	12
Keyboard	8		

ISAT scan tool basic version

The basic version of the ISAT scan tool is supplied with the following equipment:

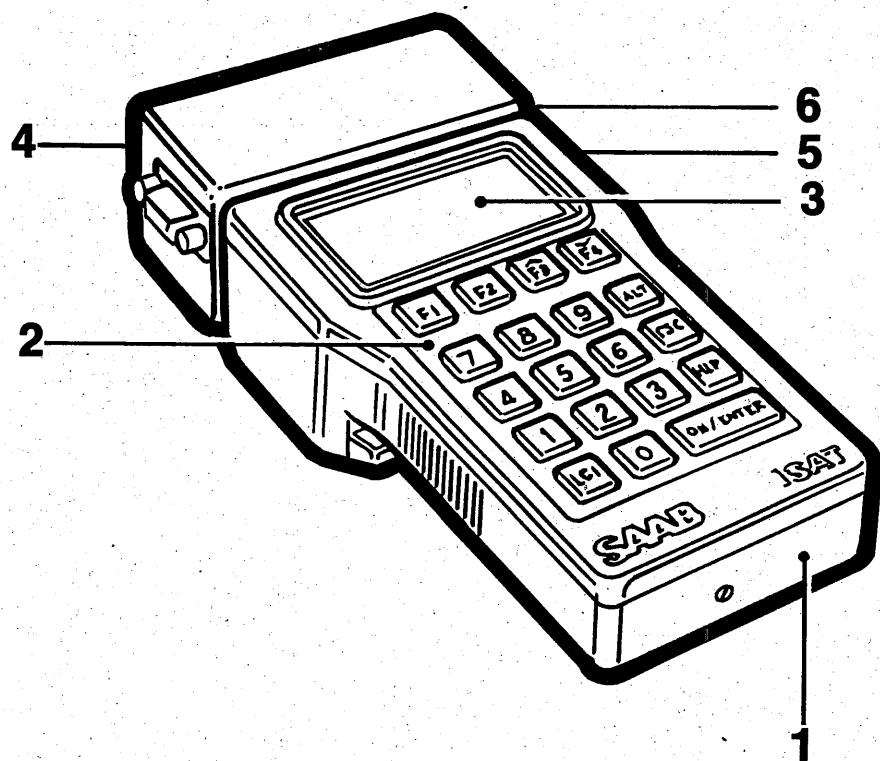

- 1 Storage and carrying case.
- 2 ISAT II scan tool instrument with rechargeable battery and memory module (part No. (16) 86 11 998) fitted.
- 3 Data link, 10-pole, part No. (16) 86 10 701.

4 Data link, 16-pole, part No. (16) 86 12 004.

5 Test cable for multimeter features with part No. (16) 86 10 719.

6 SAAB Diagnostic Adapter (SDA II) with part No. (16) 86 11 436.

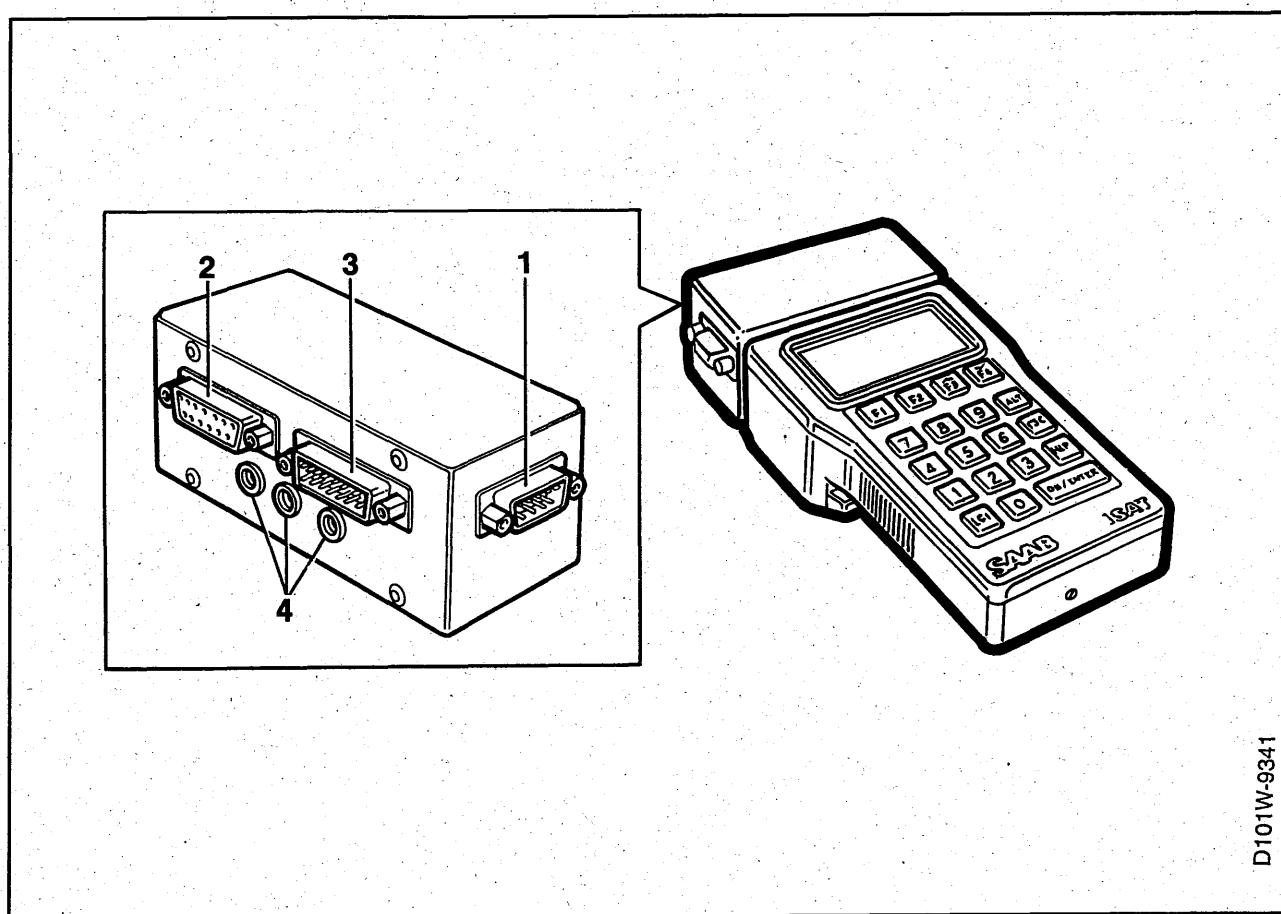

ISAT/ISAT II scan tool with SDA II

- 1 Cover over memory module and rechargeable battery.
- 2 Keyboard.
- 3 Display:
ISAT II is an updated version of the ISAT scan tool and it is fully functionally compatible. One external change is a new display with improved contrast and viewing angle. Max. display size: ISAT, 4 lines of 20 characters. ISAT II, 8 lines of 30 characters.
- 4 The SDA II is required for all measurements except temperature and when using the TSI module.
- 5 Connector for linking to temperature sensors.
- 6 Connector for linking the TSI module. The SDA II must not be connected when the TSI is used.

D101W-9340
D

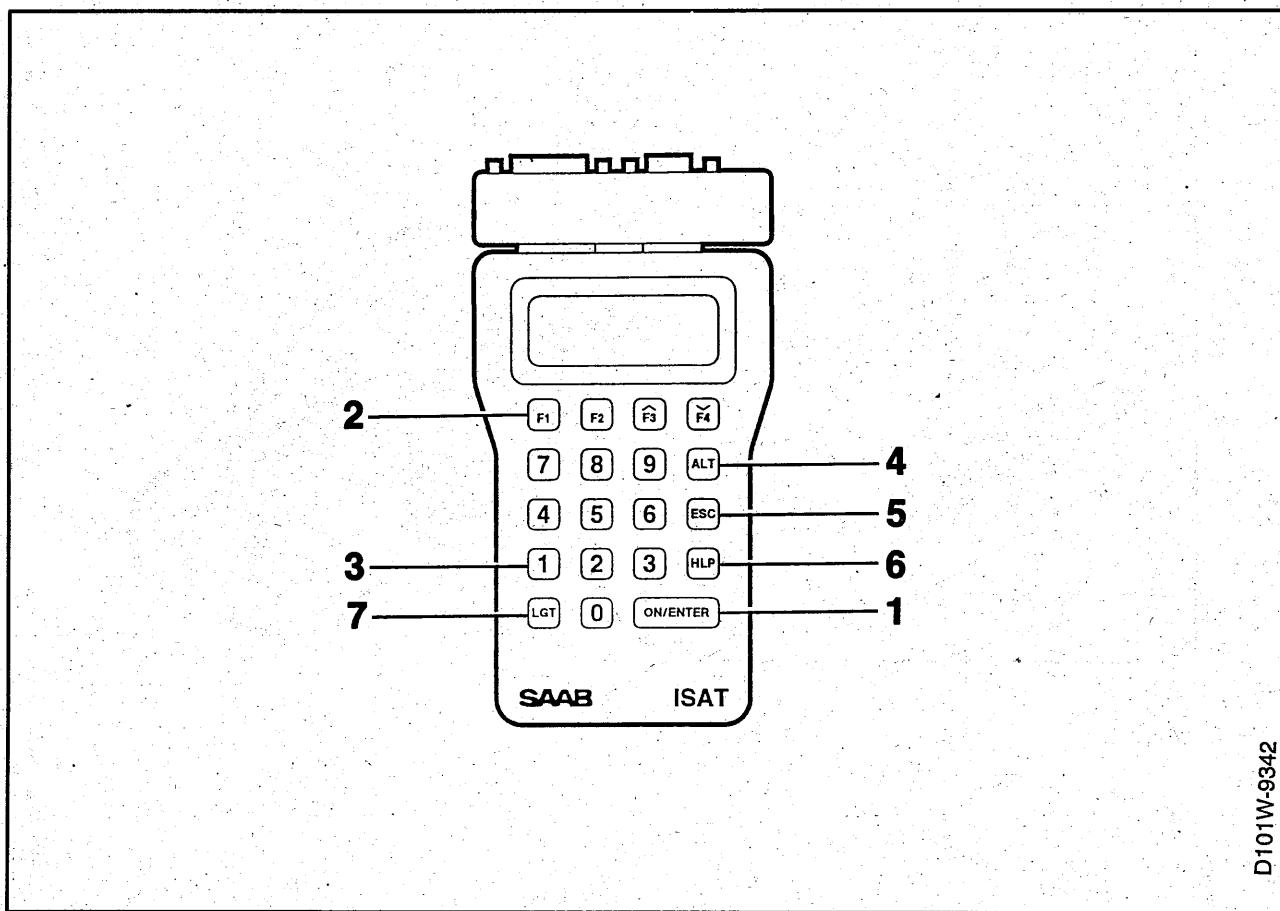

Connector, ISAT scan tool with SDA II

D101W-9341

- 1 Connector, 9-pin D-Sub for communication with the SIM module, external PC or printer.
- 2 Connector, 15-pin D-Sub for communication with the car's 16-pin diagnostic connector (900 M94-, 9000 M96-)
- 3 Connector, 15-pin D-Sub for communication with the car's 10-pin diagnostic connector (900 -M93, 9000 -M95)
- 4 Banana jacks for multimeter readings. Volts, amperes, resistance and pulse as well as PWM readings.

Keyboard

D101W-9342

The keyboard comprises 19 keys in transparent rubber.

1 "ON/ENTER" is used to switch the instrument on. This key functions as a confirmation at certain menu levels or sometimes to proceed at the same level.

2 "F1 – F4" are function keys and select the desired menu shown on the display at each key. The "F3" and "F4" keys can also be used to scroll up and down menu lists (e.g. a list of diagnostic trouble codes which is too long to be shown on the display).

3 The numerical keys are used to enter data and commands as instructed on the display.

4 "ALT" allows the user to move to the right in the menu tree on the same level, thus making it an extension of the function keys.

5 "ESC" is used to jump back in the menu tree or to cancel the current command. The "ESC" key can be considered as an "Undo" key.

6 "HLP" which stands for HELP allows access to an additional explanation of the menu function at the current level in the menu tree.

7 "LGT" has no function.

In order to switch off the ISAT scan tool, go to the main menu and select "SWITCH OFF ISAT" and then press "ON/ENTER".

A summary of menus can be found on pages 13 and thereafter.

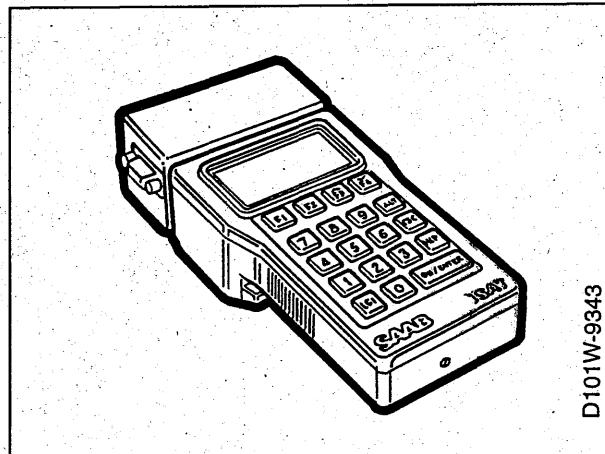

Summary of combinations

The following is a compilation of what the ISAT scan tool can read when used in combination with different modules:

ISAT scan tool + SDA II

SDA II – The Saab Diagnostic Adapter should be fitted in order for the ISAT scan tool to be able to communicate with all Saab year models. Scope of functions:

- Diagnostics/fault-tracing
- Reading diagnostic trouble codes
- Reading and activating commands
- Multimeter (voltage, current, resistance, pulse and PWM)
- Temperature

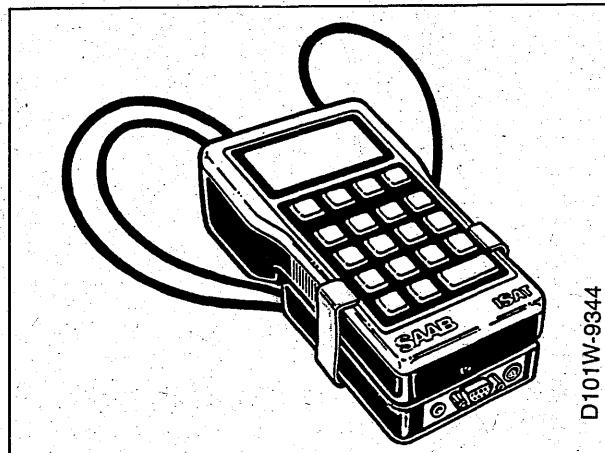

ISAT SCAN TOOL + SDA II

ISAT scan tool + TSI

In order to be able to take readings from the car's ignition and fuel systems, the TSI is used – Timing Service Instrument as a complement to the ISAT scan tool. Scope of functions:

- Ignition timing
- Dwell angle
- Engine speed
- Pulse ratio, IAC
- Lambda

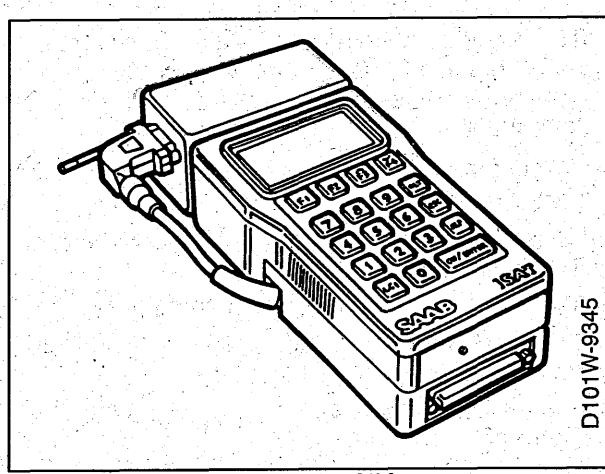

ISAT SCAN TOOL + TSI

ISAT scan tool + SDA II + SIM

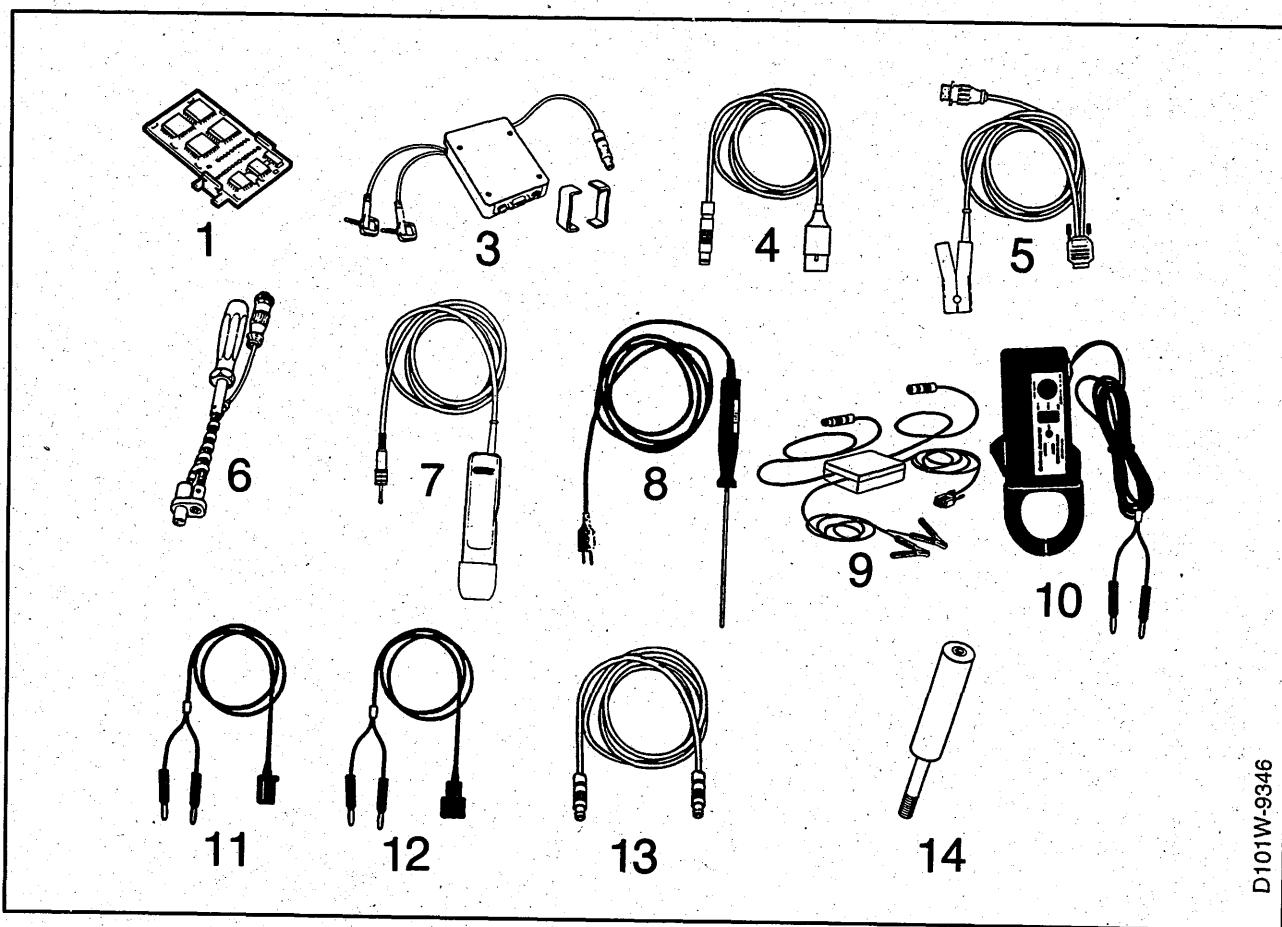

SIM – The Saab Interface Module enables the user to read control-module inputs and outputs. Readings can be automatic or manual. Scope of function:

- Active grounding point test
- Automatic/manual test
- Operational test for detecting intermittent faults
- Multimeter with calibration

ISAT SCAN TOOL + SDA II + SIM

Accessories

Accessories available for order:

- 1 Memory module for upgrading to M96, part number (16) 86 11 998.
- 2 TSI module, complete, comprising items 3–7, part number (16) 86 10 925
- 3 TSI module including connections and attachment brackets, part number (16) 86 10 941. Attachment brackets, separate, part number (16) 86 10 933.
- 4 Wiring for connection to the car's TSI connector, part number (16) 86 10 727.
- 5 Clamp sensor including wiring and connectors for TDC sensor, part number (16) 86 10 735.
- 6 TDC sensor, part number (16) 88 19 958.
- 7 Stroboscopic lamp including wiring and connector, part number (16) 86 10 958.
- 8 Temperature sensor with cable, part number (16) 86 10 750.
- 9 Pressure sensor module* for connecting to pressure sensors, part number (16) 86 10 990.

10 Current clamp for measuring current up to 600 amperes, part number (16) 86 10 743.

11 Connecting cable for oxygen sensors (lambda), CI, part number (16) 86 10 776.

12 Connecting cable for oxygen sensors (lambda), LH, part number (16) 86 10 784.

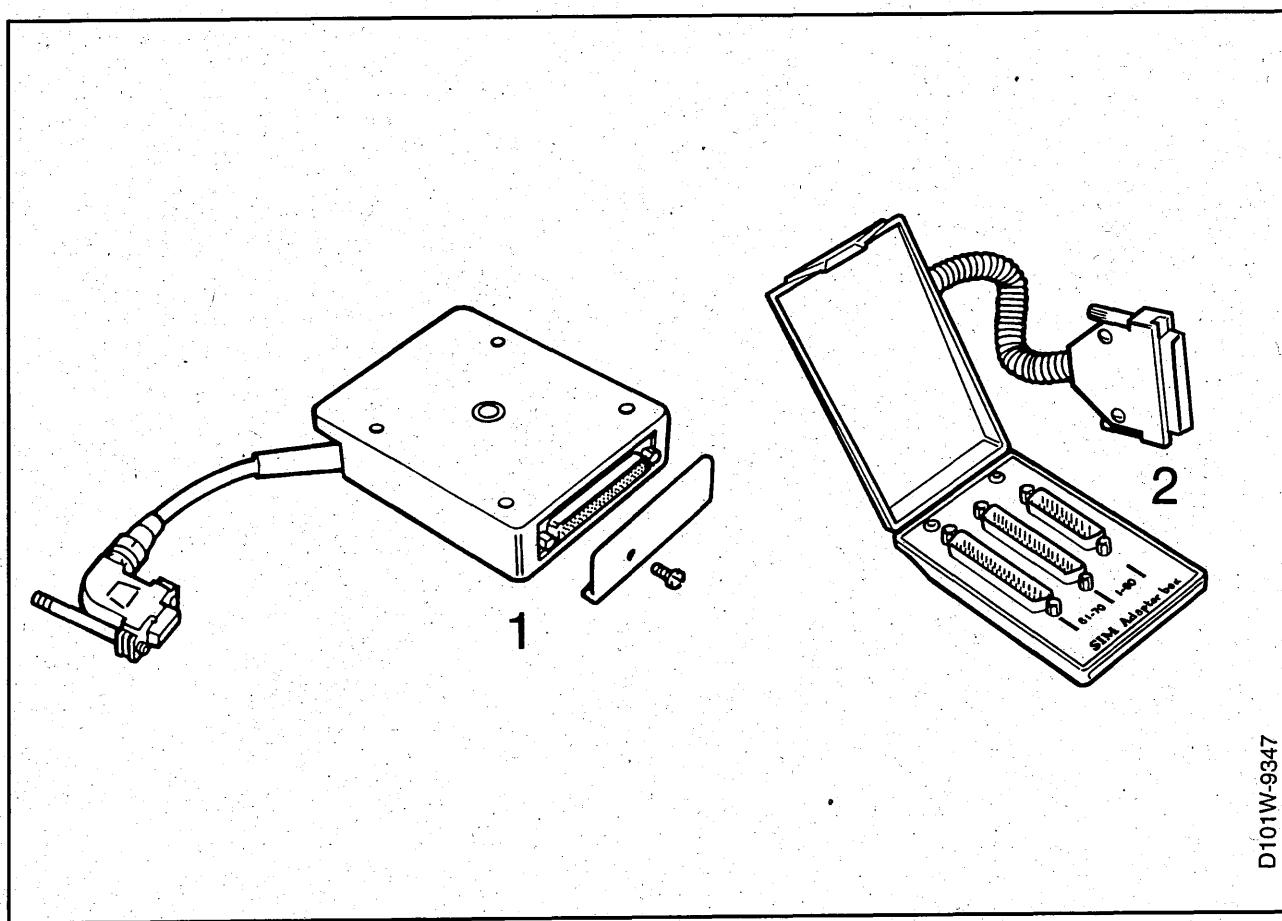

13 Adapter cable for compression testing, part number (16) 86 10 982.

14 Compression tester, sensor, part number (16) 86 10 974.

*The pressure sensor module can be used for the following systems:

- Pressure sensor for ABS tester with part number (16) 89 96 522.
- Pressure sensor for LH tester with part number (16) 83 94 355.

Accessories (contd.)

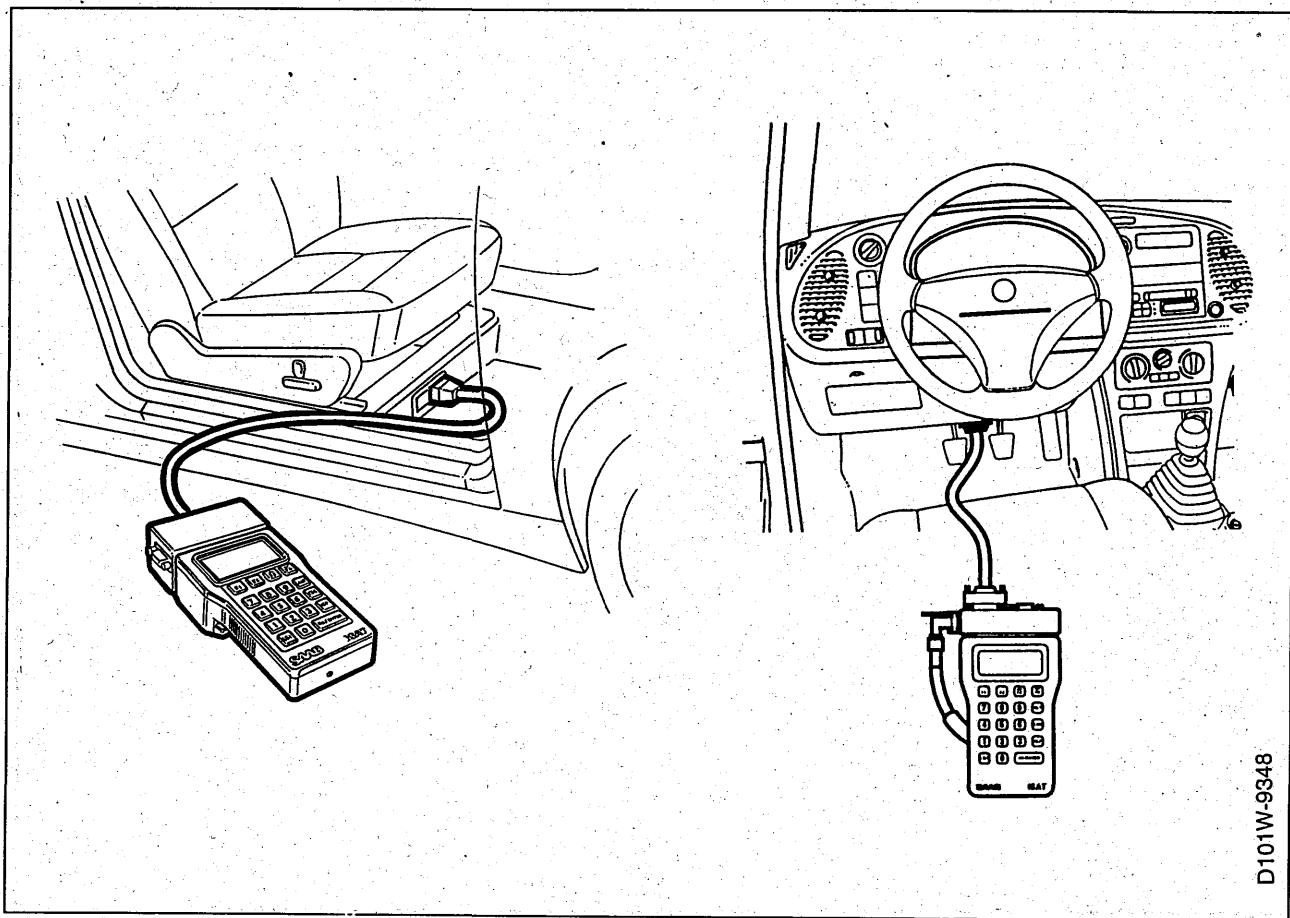

D101W-9347

SIM accessories:

- 1 SIM module with holder, part number
(16) 86 11 949.
- 2 Adapter cable, part number (16) 86 11 956.

Complete kit comprising SIM module with holder and adapter cable, part number (16) 86 11 972.

Using the ISAT scan tool

D101W-9348

Example with the ISAT scan tool connected to the car via the data link connector.

The ISAT scan tool is used and connected to the car according to the instructions given in the fault diagnosis sections of the service manuals.

The menus in the ISAT scan tool are described down to system level in this manual. In addition to this, the service manuals apply.

If an incorrect (not valid) command is given the ISAT scan tool can:

- Freeze and the screen go out
- Freeze with the display remaining
- Attempt to execute the command, locking the ISAT scan tool until time-out (a predetermined time before new commands can be given).

Press **ESC** for 10 seconds after time-out.

If the problem remains disconnect and reconnect the data link.

As a last resort, remove and refit the ISAT scan tool's internal battery.

Note

Poor ISAT scan tool communication can be due to a poorly charged internal battery. A discharged battery takes about 14 hours to recharge.

Using the menus

Introduction	13
Self-test, PC, upgrading and language	14

Introduction

When the ISAT scan tool is switched on or is connected to the car and thus supplied with a voltage, you will see a number of intermediate menus before the main menu is displayed. The ISAT scan tool carries out an internal test of the software. See page 14 for the SELF TEST menus.

The intermediate menus give:

- The serial number of the ISAT scan tool.
- The version number of the ISAT scan tool software.
- The date of the version number.
- Messages concerning whether the ISAT scan tool software complies with the internal program test.

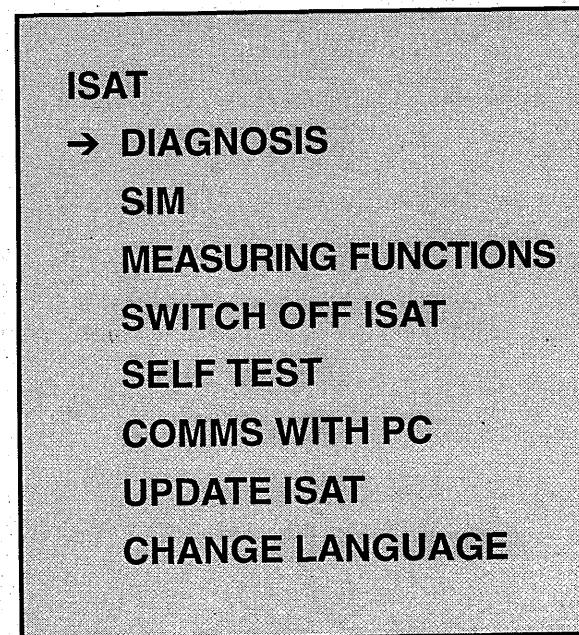

If the software does not complete the internal test "SELF TEST NOT OK" is shown on the display.

The desired function is selected from the main menu.

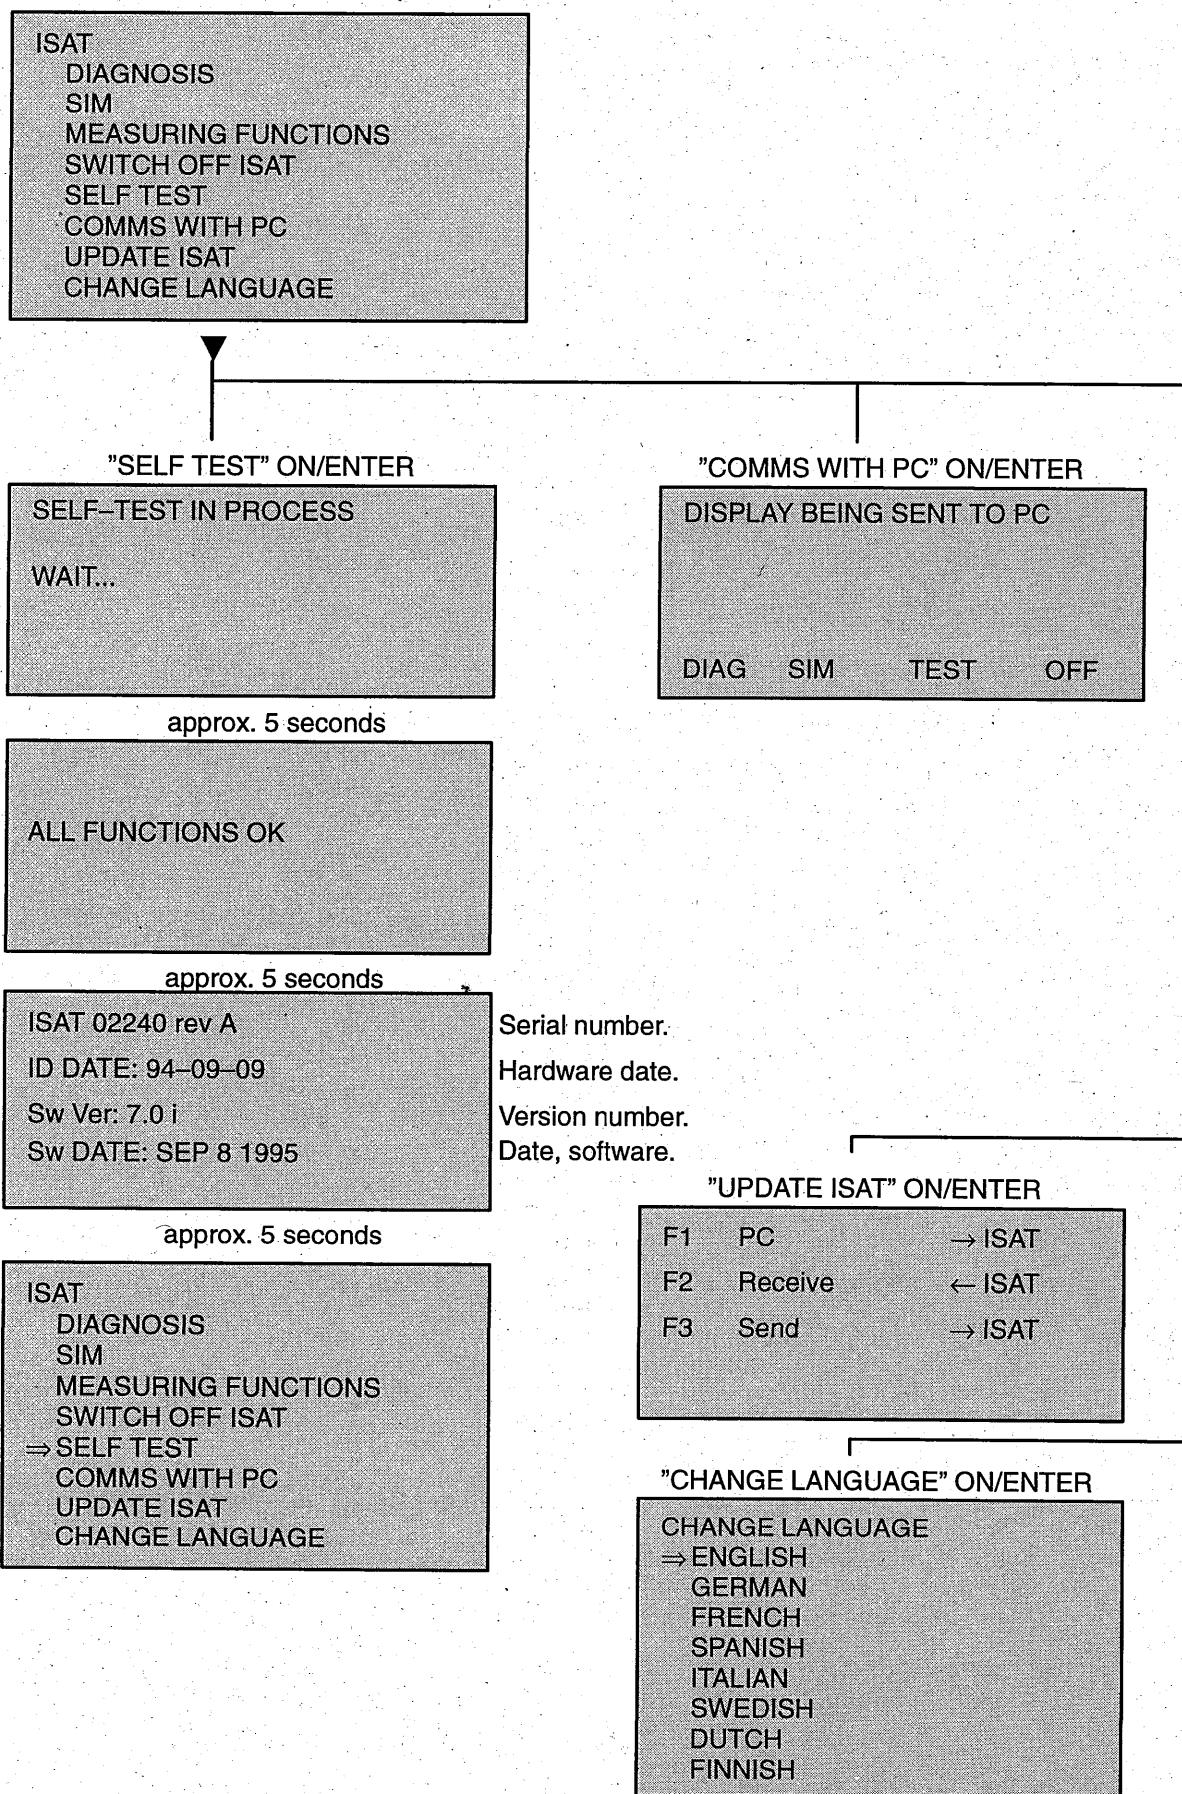

There may be functions in addition to those currently shown on the display. These can be accessed by scrolling the menu using F3 and F4. Pressing **ON/ENTER** selects the function the arrow is pointing to.

The ISAT scan tool has the following functions:

- **DIAGNOSIS:** Communication with the desired control module via the car's data link connector.
- **SIM:** Communication via the SIM module and its functions.
- **MEASURING FUNCTIONS:** Analogue multimeter functions.
- **SWITCH OFF ISAT:** On and off.
- **SELF TEST:** Internal test of the ISAT scan tool software.
- **COMMS WITH PC:** ISAT scan tool communication with a PC (personal computer).
- **UPDATE ISAT:** Updating the software version in the ISAT scan tool using a PC or another ISAT scan tool.
- **CHANGE LANGUAGE:** Selection of language.

Reading TSI functions	22
Reading V, I, R, pulse and PWM	23
Reading temperature, pressure and compression	24

Connection, TSI

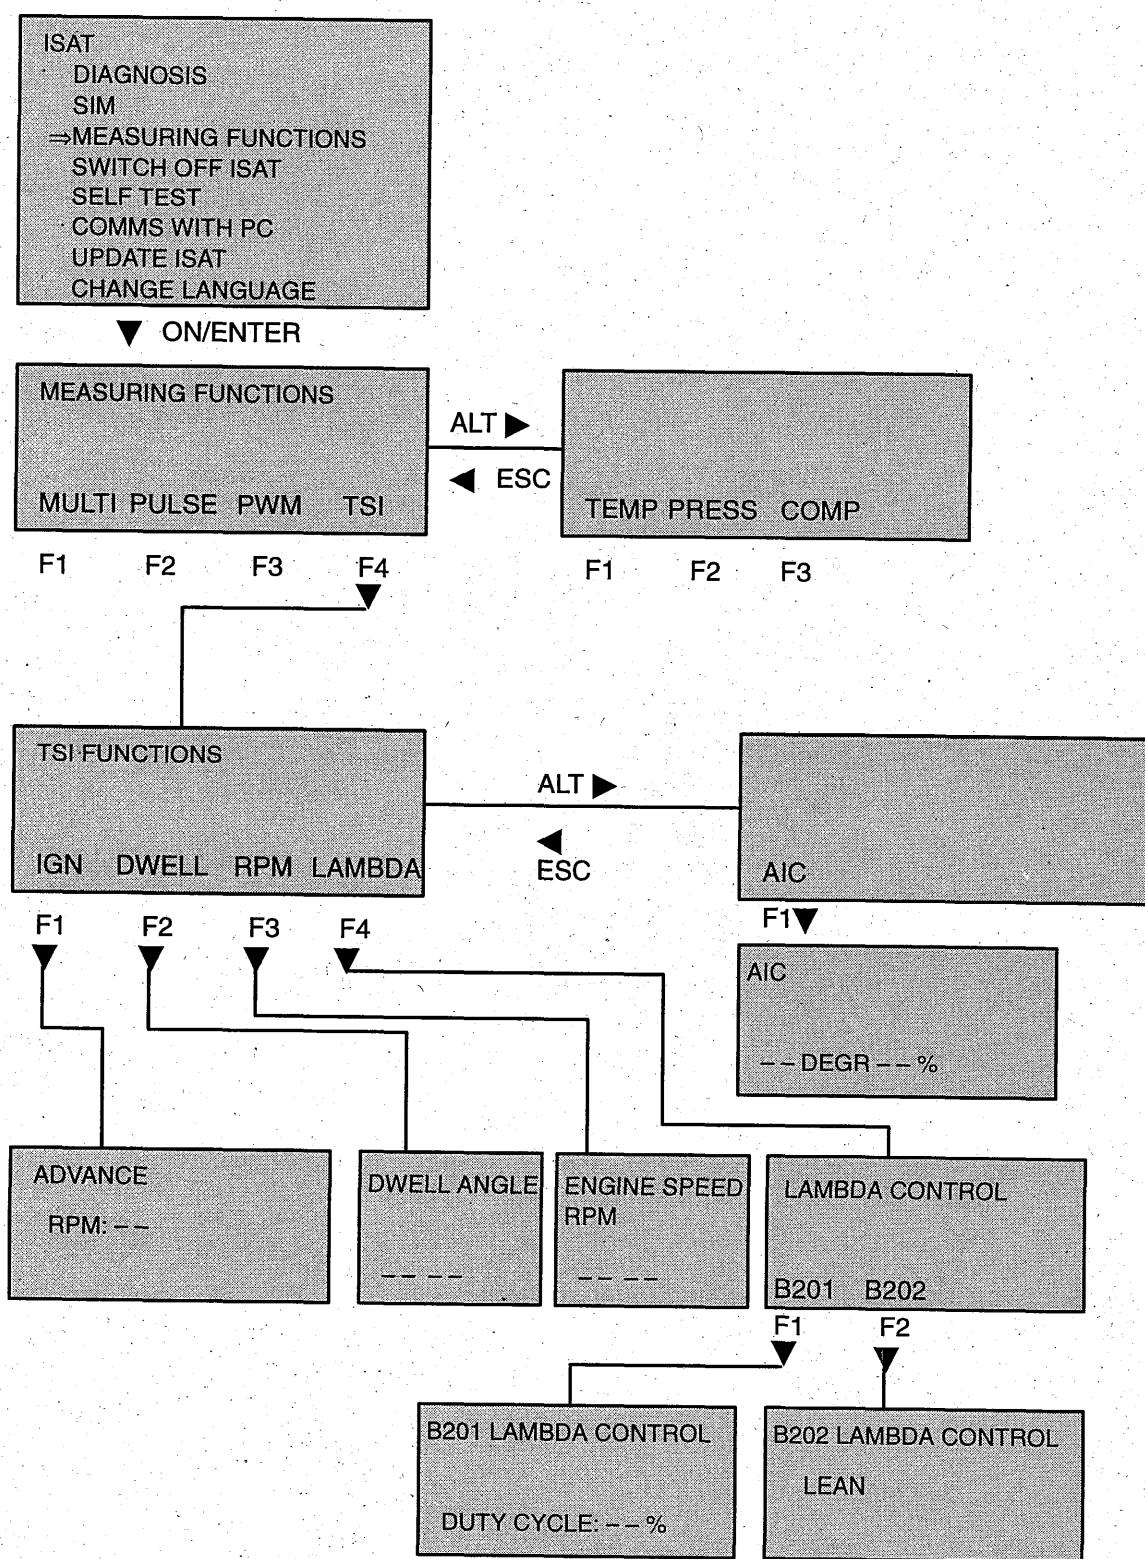

D101W-9349

When taking readings from the car's ignition system, the TSI module should be connected to the ISAT scan tool. The SDA II module is not used in this case.

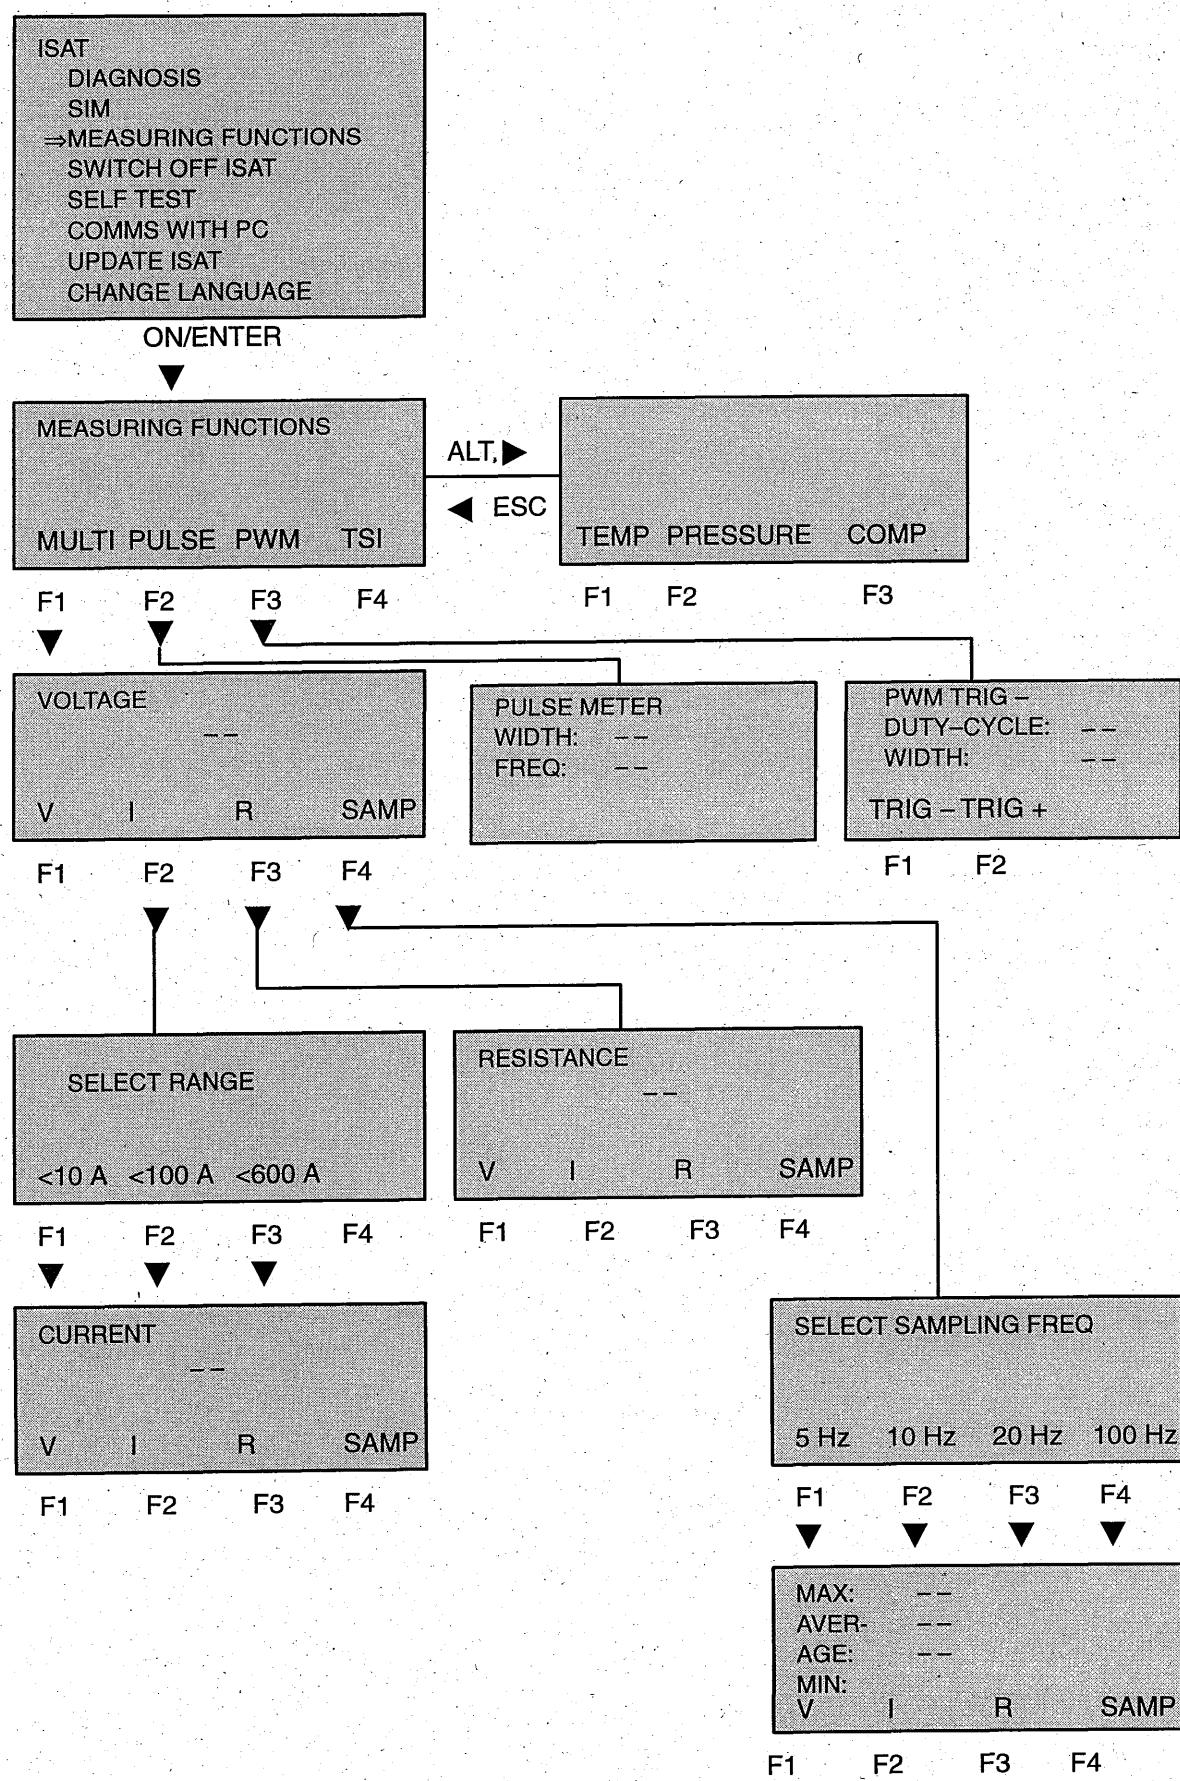

Connect the TSI module as follows:

- 1 Place the TSI module on the underside of the ISAT scan tool. Secure the module with the clips.
- 2 Connect the leads from the module to the ISAT scan tool's TSI connector and to the red and black connectors.
- 3 Then connect the TSI wiring between the car's TSI socket and the corresponding socket on the module. Connect the inductive clamp sensor and TDC sensor to the module's D-9 connector. The strobe lamp is connected to the third socket on the module.

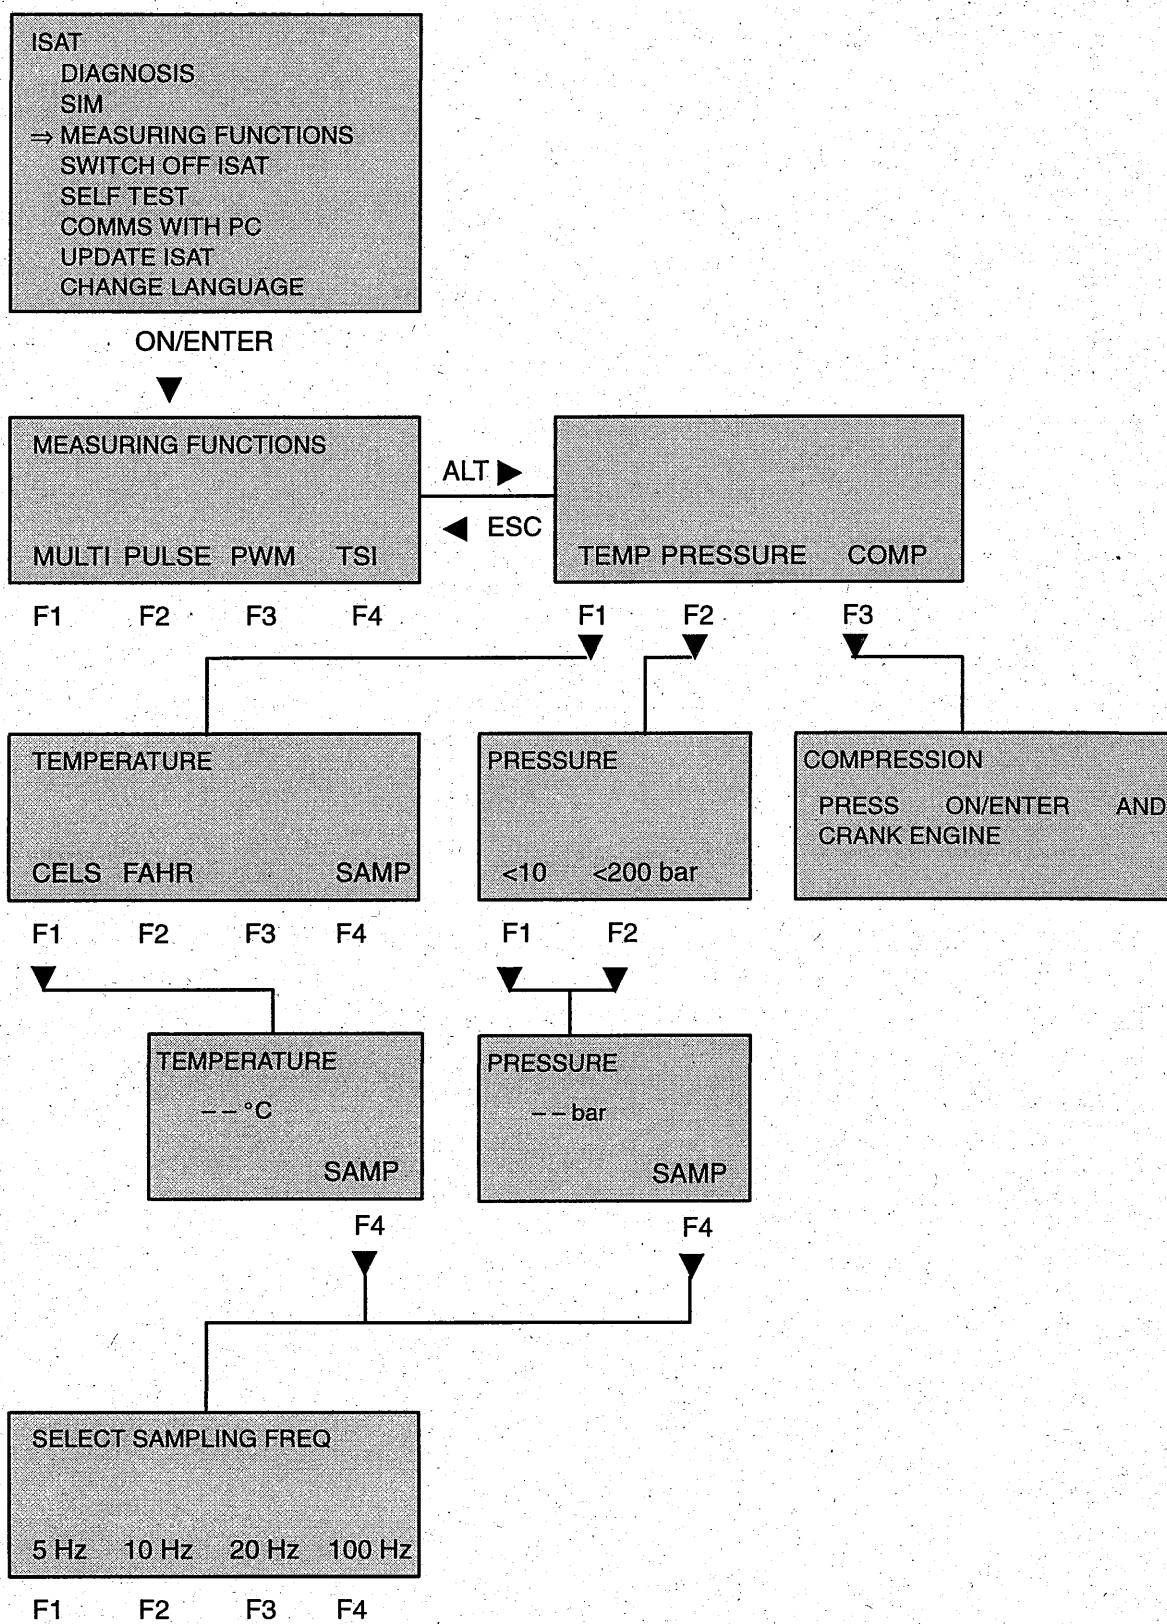

Reading TSI functions

SIM module

1 SIM module

D101W-9350

SIM module

The SIM module has the following main functions:

Automatic test

Reads the control module pins in logical order according to a predetermined sequence. The sampling speed between the pins is less than 10 milliseconds.

Manual test

Identical to the automatic test but with manual control which makes it possible to take a continuous reading from any individual pin.

BOB test method

Reads any three ECM pins at the same time or three different units on the same pin; voltage, frequency or pulse time/pulse ratio.

Test while driving

Automatic test of the control module pins while driving in order to detect intermittent faults. The test runs continuously until a fault is detected.

Active test on grounding points

A quick automatic function for testing grounding points in relation to battery negative. The SIM loads the particular grounding point with about 1–2 amperes.

System readings

Continuously measures four pre-programmed parameters. These parameters are selected by the mechanic before each test.

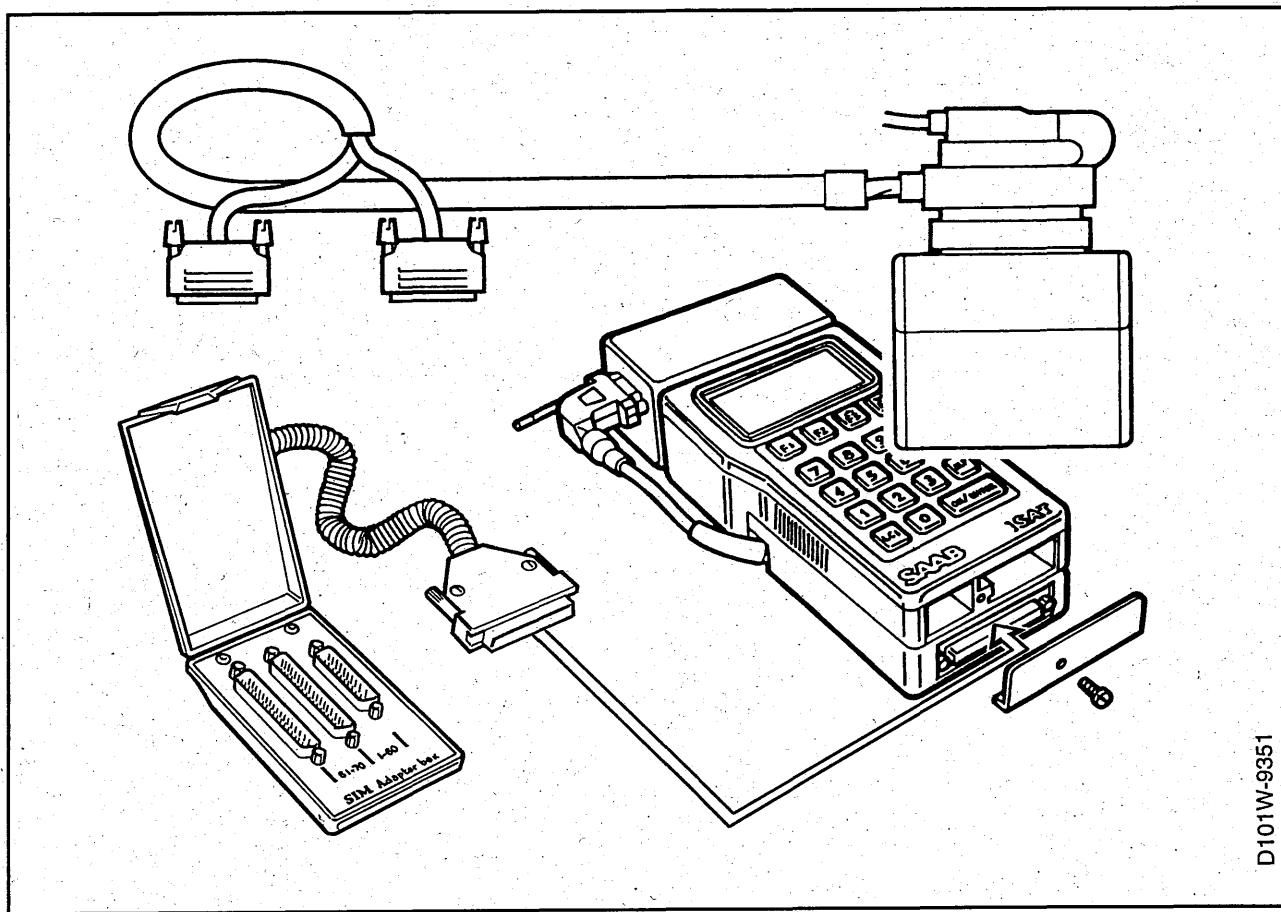

Multimeter feature

A complete multimeter feature is included in the software with a calibration feature for accuracy comparable to commercially available multimeters.

Printout feature

Ability to print from a printer.

Connection, SIM

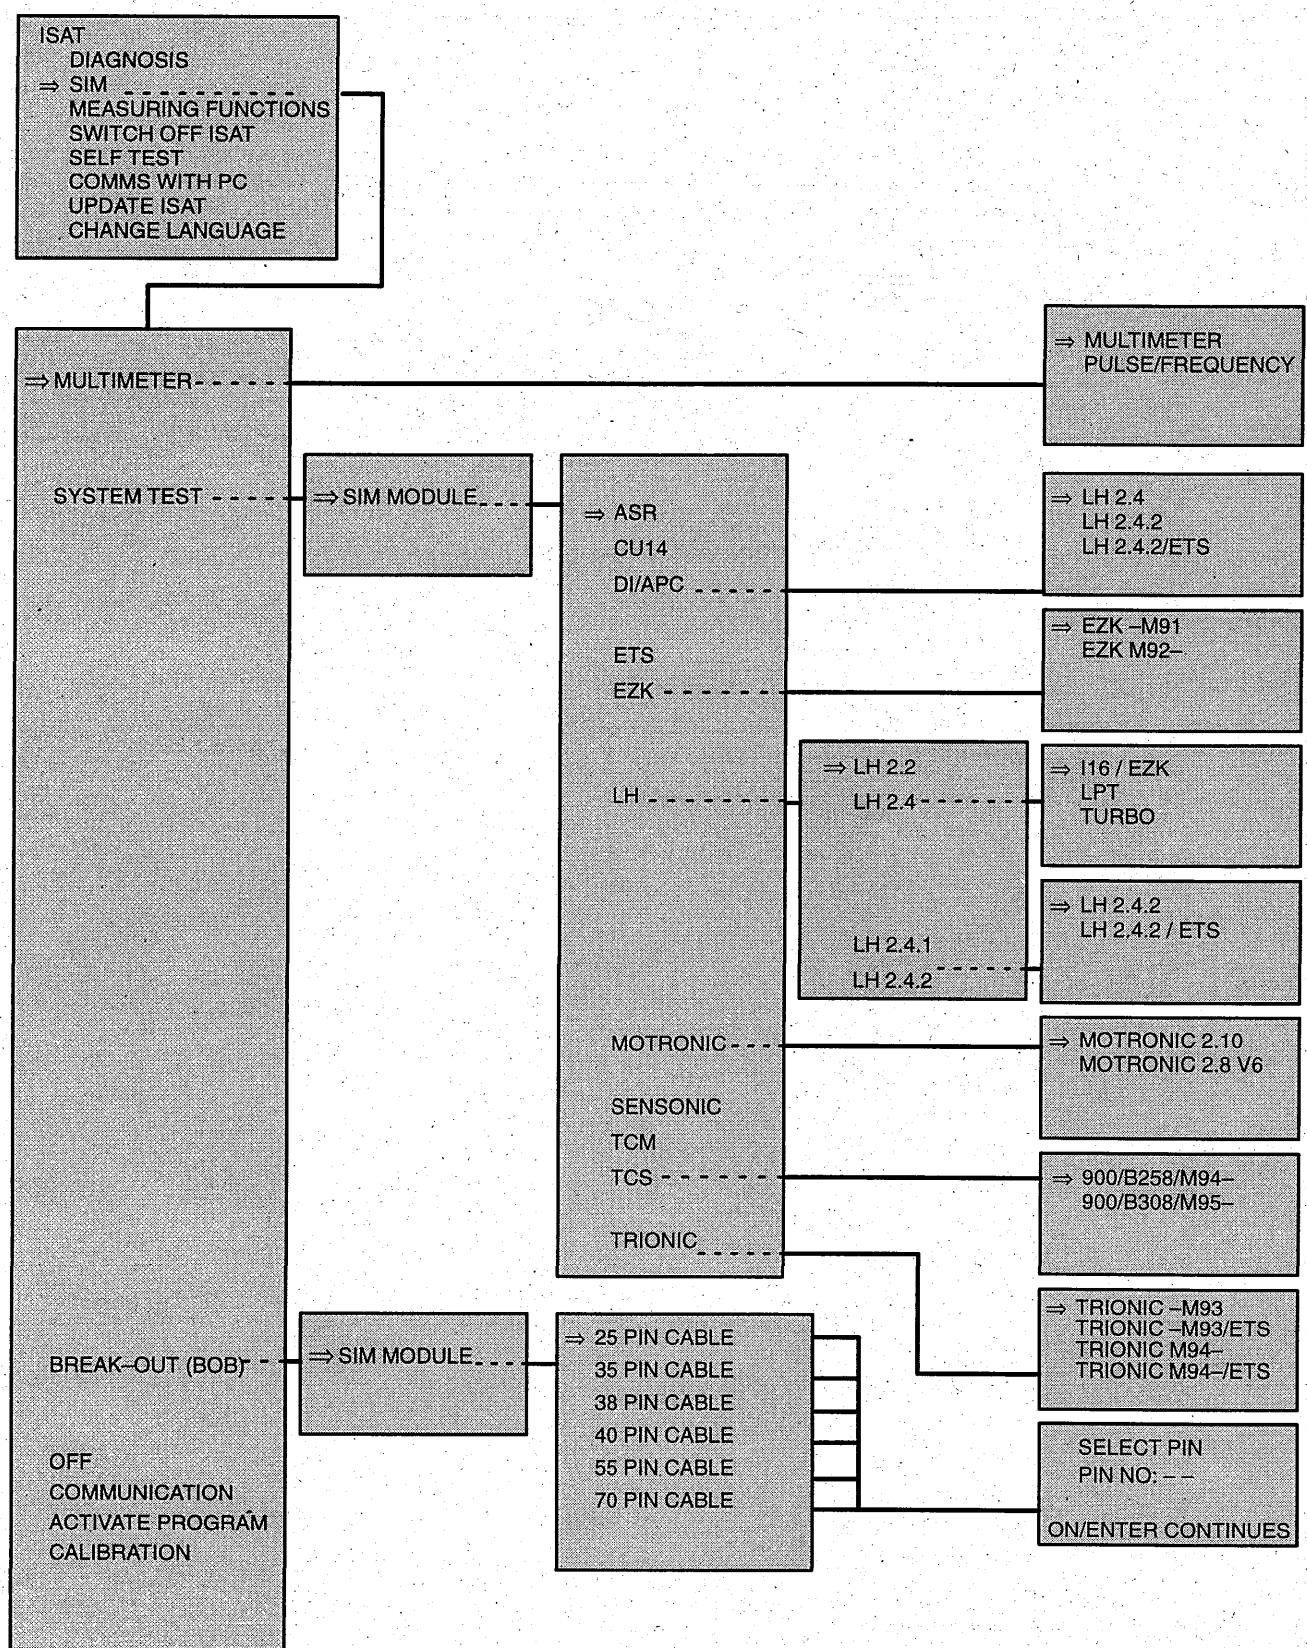

In order to use the SIM and its features, connect as follows:

Connection to the car's control module with the appropriate BOB lead is required. The BOB lead acts as a link between the car's wiring harness and the control module's connector. This allows all control module inputs and outputs to be read.

- 1 Place the SIM module on the underside of the ISAT scan tool. Secure the module using the plate.
- 2 Connect the SIM module connector (9 pin D sub) to the SDA II connector for communication.
- 3 Connect the SIM adapter cable to the SIM module.
- 4 Connect the appropriate test cable (BOB cable) to the chosen control module.
- 5 Connect the test cable (BOB cable) to the SIM adapter (25 pin and 37 pin D sub).
- 6 Power the ISAT-SIM by connecting the particular data link to the car's data link connector.

Menu overview

Activating the SIM

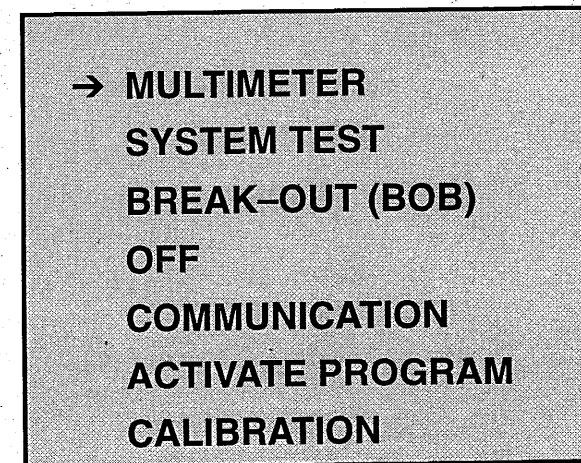

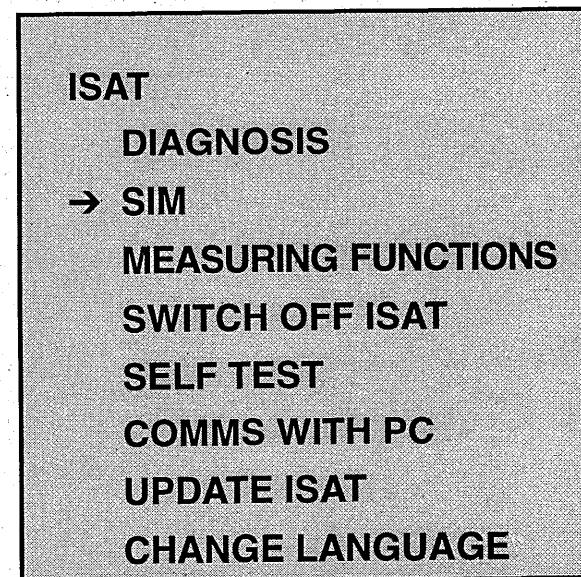

In order to use the features of the SIM, the SIM module must be connected to the ISAT scan tool. See page 27.

Select SIM from the main ISAT scan tool menu and press **ON/ENTER**.

The message **WAIT...** is displayed for 5 seconds and the display then switches to the main SIM menu.

Main SIM menu

F3 and **F4** are used to browse in the menu.

Calibration

Important

Calibration must be carried out each time the memory module is changed.

Select CALIBRATION and press ON/ENTER.

OFF
COMMUNICATION
ACTIVATE PROGRAM
→ CALIBRATION

Enter the number 1, 6, 0 and press ON/ENTER.

CALIBRATION
(ONLY FOR SERVICE)
ENTER PASSWORD _____

In order to proceed, connect a bridge (short circuit) between the black and red banana sockets on the SDA II.

Press ON/ENTER.

The message WAIT... will be displayed for 5 seconds.

SHORT CIRCUIT
MULTIMETER!

ON/ENTER CONTINUES

Wait until the display to the right is shown.

Calibration is now complete. All analogue reading features under the MULTIMETER and BOB menus are calibrated. Calibration is henceforth automatic when SIM is selected.

REMOVE SHORT CIRCUIT!

ON/ENTER CONTINUES

Communication

The communications part of the SIM confers the ability to transfer the test result to a PC and to show the status of the SIM.

Use **F3** and **F4** to browse in the main SIM menu.
Select **COMMUNICATION** and press **ON/ENTER**.

Selecting **PC** and pressing **ON/ENTER** starts downloading the test result to a PC.

Select **PROGRAM VERSION** and press **ON/ENTER**.

SIM status is displayed together with the version number of the software and its date.
The adjacent menu is one example.

MULTIMETER

OFF
→ COMMUNICATION
ACTIVATE PROGRAM
CALIBRATION

PC
→ PROGRAM VERSION

SIM Ver: 2.0 A
Sep 5 1995

ON/ENTER CONTINUES

Multimeter

The multimeter feature is included in the SIM software, with a calibration feature which provides test accuracy comparable to commercially available multimeters. The following is a list of the available features.

Select multimeter from the main menu and press **ON/ENTER**.

Select multimeter from this menu too and press **ON/ENTER**.

The SIM measures voltage using the red and the black cables connected to the SDA II module.

Example: Press **F2** to measure current.

Select the appropriate range by pressing:

F1 (<10) = 0 – 10 amperes

F2 (<200) = 10 – 200 amperes

F3 (<600) = 200 – 600 amperes

Use the red and the black connectors on the SDA II module.

Important

Use only lead 86 10 719 in order to prevent damage to the ISAT scan tool.

When measuring current above 10 amperes, current clamp 86 10 743 must be used.

The ISAT scan tool is equipped with a 10 ampere fuse in the red socket on the SDA II.

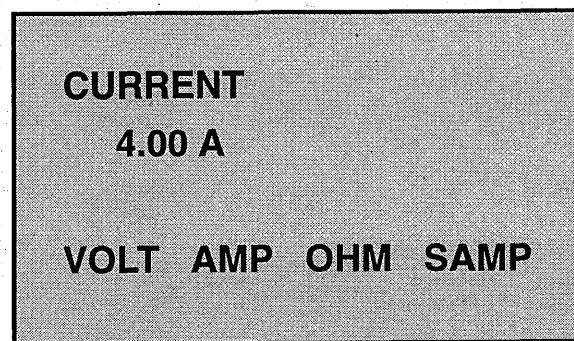

→ MULTIMETER
PULSE/FREQUENCY

VOLTAGE
-0.00V
VOLT AMP OHM SAMP

SELECT RANGE
<10A <200A <600A

Multimeter (contd.)

If the range <10A is selected, the display may appear as in the figure to the right.

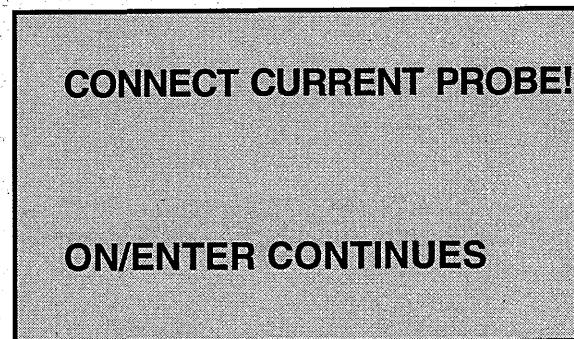

If range <200A or <600A is selected, the display will appear as in the figure to the right.

Important

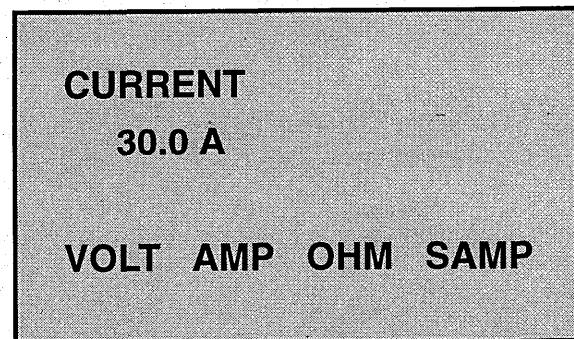

Current clamp 86 10 743 should be connected before **ON/ENTER** is pressed in order to proceed.

Press **ON/ENTER** to proceed.

The display may appear as in the figure to the right. Resistance can be measured by pressing **F3**.

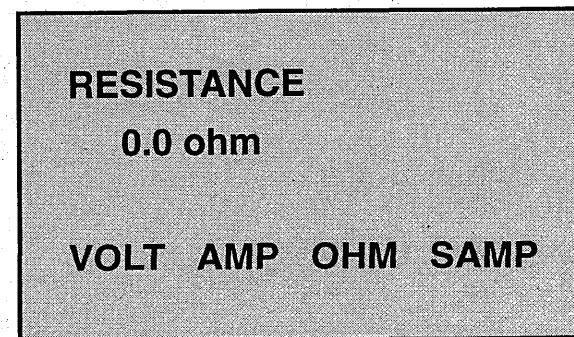

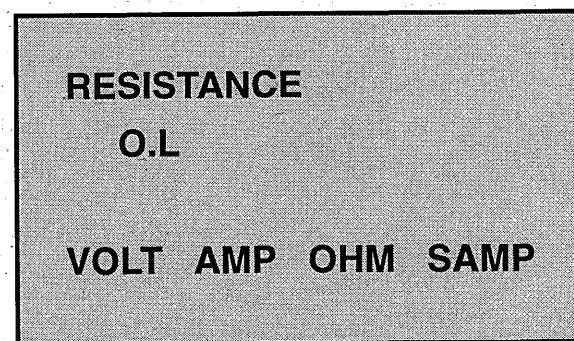

The resistance feature automatically selects range and the red and black socket on the SDA II module should therefore be used.

For a quick and simple test before taking a reading, short circuit the cables with each other and check whether a zero level is achieved.

If a zero level is not achieved, check that the fuse is intact and spray the contacts with Kontakt 61.

Multimeter (contd.)

For all multimeter features; voltage, current and resistance, there is the capability of taking several readings over a certain time period (sampling). This method of taking readings can provide more reliable readings and can detect interference from external sources.

When sampling, the quantity being measured (voltage, current or resistance) is first selected.

Press the function key for sampling.

Then select SELECT SAMPLING FREQ

Press ON/ENTER.

→ SELECT SAMPLING FREQ

Then select the sampling frequency you consider appropriate.

Press ON/ENTER.

→ 5 Hz
10 Hz
20 Hz
100 Hz

Test measurement can be stopped by pressing **ESC**. If this is not done, the result is automatically displayed when reading is complete. The time to take readings depends on the sampling range selected and can vary between 10 and 200 seconds.

After readings are complete, the display is as in the example to the right.

Press **ESC** to access the multimeter menu.

MAX: 0.1V
AVERAGE: 0.05V
MIN: -0.10V
ON/ENTER CONTINUES

Multimeter (contd.)

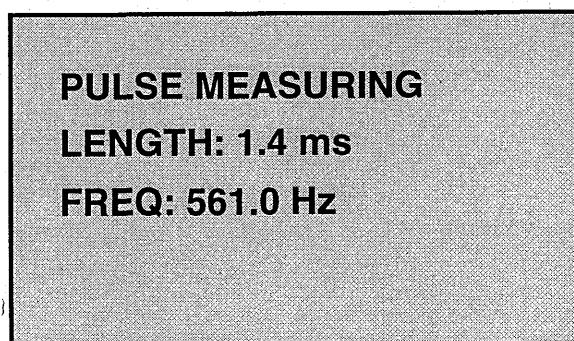

Select Pulse/frequency and press ON/ENTER.

The figure to the right shows a display example.

In order to measure pulse width and frequency, cables 86 10 719 should be connected to the SDA II.

Press **ESC** to get back to the multimeter menu.

Press **ESC** to get to the main menu.

System test

The system test is the main SIM function.

All electronic engine and gearbox systems up to M95 are under the System test menu.

Select SYSTEM TEST from the SIM main menu and press ON/ENTER.

Press ON/ENTER.

→ SIM MODULE

Select the system to be tested.

Example

Select Trionic and press ON/ENTER.

ASR
CU14
DI/APC
ETS
EZK
LH
MOTRONIC
SESONIC
TCM
TCS
→ TRIONIC

Select Trionic M94-/ETS and press ON/ENTER.

TRIONIC –M93
TRIONIC –M93/ETS
TRIONIC M94
→ TRIONIC M94-/ETS

System test (contd.)

This is the SYSTEM TEST menu.

Use **F3** and **F4** to browse in the menu.

The menu alternatives below require that one of the test modes is carried out. If this is not the case, the following message is displayed/sent:
No test in memory!

DISP. TEST RESULTS: Displays the result.

PRINT TEST: All or only faulty readings are downloaded to the printer.

SEND TEST TO PC: All test readings are sent to the PC.

TESTINFO: Selected systems will be displayed.

Other menu selections are given in the list of contents.

Select the required test version and press **ON/ENTER** to proceed. The appropriate Service Manual takes over at this point.

→ AUTOMATIC TEST
MANUAL TEST
SYSTEM READINGS
TEST WHILE DRIVING
DISP. TEST RESULTS
PRINT TEST
SEND TEST TO PC
TESTINFO

Automatic test

The automatic test is used to quickly check the functions of a control system. The control module inputs and outputs are automatically read.

Active pins are checked in a predetermined sequence. While the readings are being taken, questions will be asked and information will be shown on the display. For example "Ignition on?", "Manual gearbox?". Answer the questions and execute the commands.

Use **F1** to answer YES and **F2** to answer NO.

When the ISAT scan tool is taking readings, the display will show "WAIT...". If the readings are outside the range, the result is presented, the ISAT scan tool starts to beep, the reading flashes and the message "ALARM" is displayed. For more details, see page 40. If no command is given within 20 seconds, the ISAT scan tool will beep again. Press **F1** to proceed.

Note

All measured parameters require that the engine has reached its operating temperature.

If tests are carried out before the engine has reached its normal operating temperature, some systems such as the oxygen sensors and EVAP canister may not be active. This causes the readings to be interrupted until the particular system becomes active.

If the car is equipped with an alarm, this can influence the readings, especially if the alarm is self-arming. If this is the case, the alarm should be switched off or disconnected.

Automatic test (contd.)

Example

The following procedure is one example of how an automatic test may look. The test varies according to the system selected.

Important

When an active ground test is being carried out, the ISAT scan tool allows about 2 amperes to flow through the relevant grounding points in order to detect loss of power or resistances which are too high.

Press **F1** for **yes** and the display shows the following:

Press **F2** for **no** if the test is not to be carried out.

The BOB wiring should be connected to the car's wiring harness but **not** to the ECM. This is to prevent damage during the active grounding point test.

When the BOB wiring is connected to the car but **not** to the ECM, press **ON/ENTER** and the active ground test takes about 2 seconds.

The ISAT scan tool provides a warning if the reading does not comply with the specification for the particular model of car.

Connect the BOB wiring to the ECM and press **ON/ENTER** and the automatic test continues.

ACTIVE GND CHECK?

YES NO

**CONNECT TEST CABLE
TO THE CAR
NOT TO THE ECM
ON/ENTER CONTINUES**

**RECONNECT TEST CABLE
TO ECM
ON/ENTER CONTINUES**

Automatic test (contd.)

A command on the display may appear as in the adjacent figure. When the ignition is set to ON, the automatic test continues.

The display shows the message "WAIT" while readings are being taken.

If you wish to end the test, press **ESC** and confirm by pressing **F1** for yes.

The test is carried out automatically. If any reading is outside the nominal limits, the test is interrupted and the following example may be shown on the display.

The first line shows what it is in the car which is being measured and which control module pin numbers the component has. In this case, 56.

The second line shows the actual reading. The reading flashes if it is outside the ISAT scan tool nominal limits and the message "ALARM" is displayed.

The third line shows what nominal limits apply.

The fourth line presents the following choice:

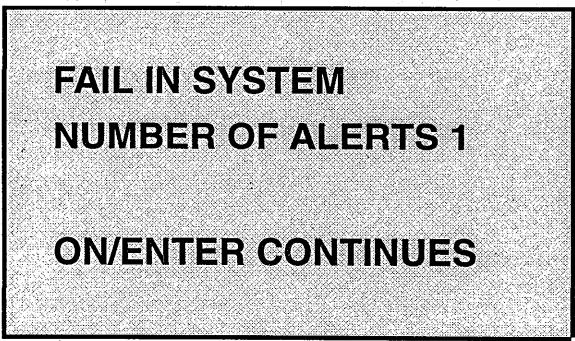

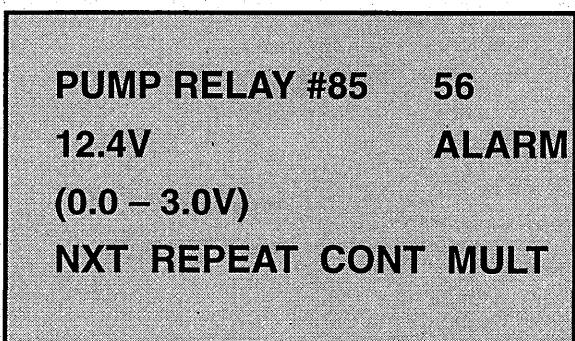

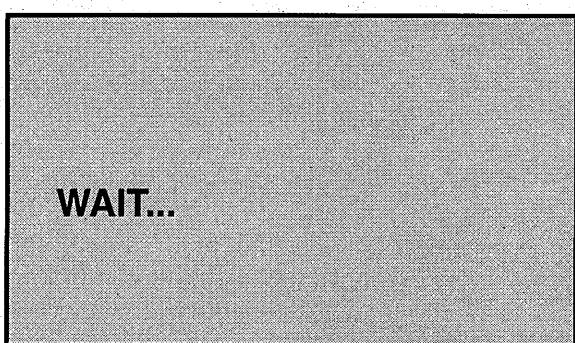

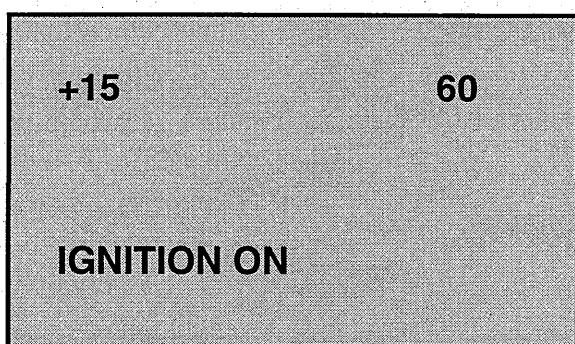

NXT – continues test or jumps to the next pin during the manual test.

REPEAT – repeats the pin test.

CONT – gives continuous reading on the selected pin and shows lowest and highest readings as well as current reading.

MULT – allows access to the multimeter and BOB functions.

If any of the readings is outside the range, the number of faults is shown. Press **ON/ENTER** to proceed.

Automatic test (contd.)

When the test is completed and the system has been demonstrated to be free of faults, this is shown on the display. Press **ON/ENTER** to proceed.

Select **DISP. TEST RESULTS**.

Press **ON/ENTER**.

**SYSTEM OK
NO FAULTS FOUND**

ON/ENTER CONTINUES

**→ DISP. TEST RESULTS
PRINT TEST
SEND TEST TO PC
TEST RESULTS**

If there are readings stored, the following is displayed:

ALL VALUES – retrieves readings from each pin.

ONLY FAULTS – shows only the readings outside nominal limits.

Press **ON/ENTER** to view stored readings. When all faults have been displayed, the number of faults is also shown. The ISAT scan tool then automatically returns to the system menu.

**→ ALL VALUES
ONLY FAULTS**

If there are no readings, the message below is displayed for about 5 seconds, after which the system menu is displayed.

NO TEST IN MEMORY!

Manual test

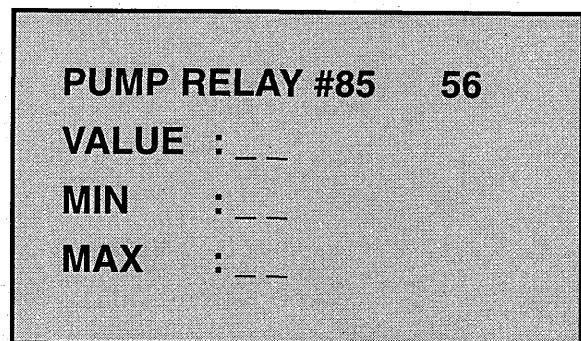

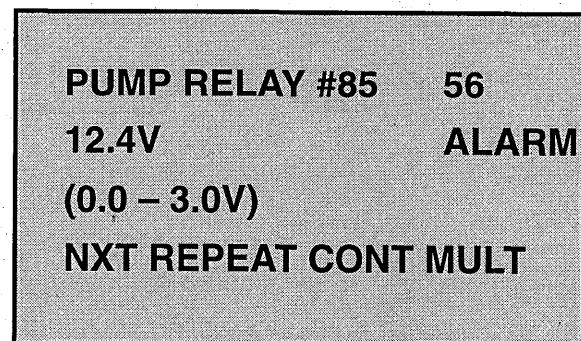

The manual test follows the same procedure as the automatic one but shows all readings during the reading sequence. As with the automatic test, questions are displayed which require a response. Unlike the automatic test, **F1** must be pressed after each reading has been displayed in order for the test to continue.

If there is any confusion about the current reading, repeat the measurement by pressing **F2** for REP. CONT – the unit being measured is continuously displayed as well as highest, lowest and current readings. See the display to the right below.

MULT – normal multimeter function activated.

For a more detailed explanation of the adjacent display, see page 40.

Continuous display of e.g. pump relay. Highest, lowest and current readings are displayed.

System readings

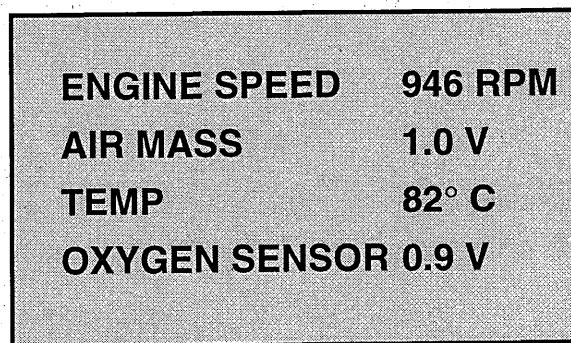

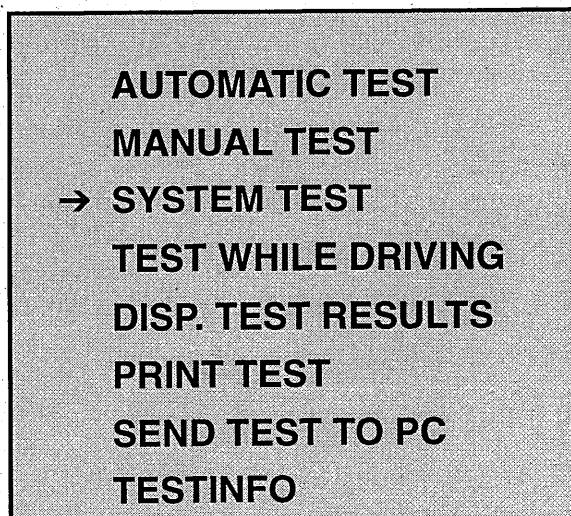

System readings contains a predetermined test program to facilitate fault diagnosis on the car. Testing includes engine speed, mass air flow signal, engine coolant temperature and oxygen sensor signal.

- Select SYSTEM TEST from the system test menu and press ON/ENTER.

Start the engine and read the test values.

The program is predetermined and cannot be modified.

Press **ESC** to return to the system menu.

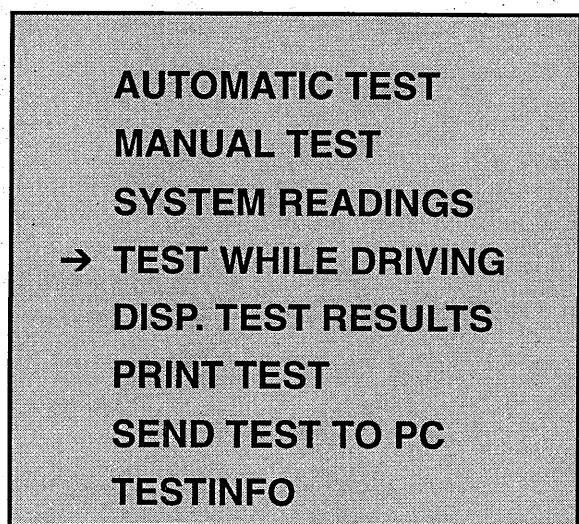

Test while driving

Automatic continuous test of ECM pins during the test drive in order to detect intermittent faults.

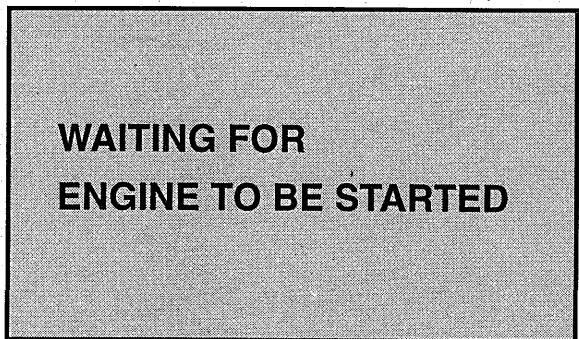

Select TEST WHILE DRIVING

Press **ON/ENTER**.

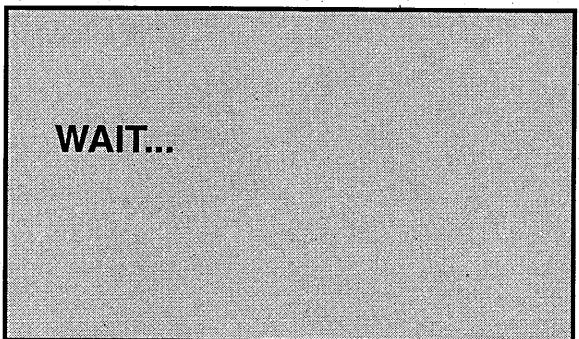

Execute the commands shown on the display.

Start the engine.

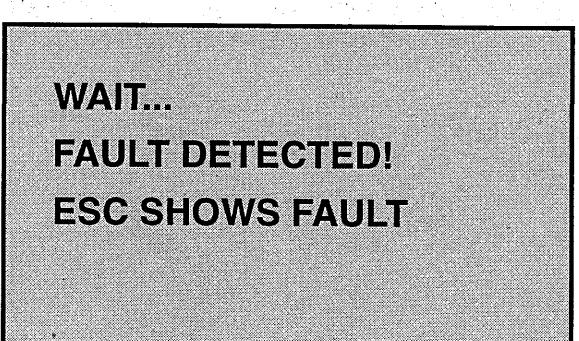

The display continues to show WAIT until a reading exceeds the nominal limits.

When a fault arises, a message is displayed. Press **ESC** in order to find out what is wrong.

Note

The engine must be running. If this is not the case, **ESC** means return to subsystem menu.

Test while driving (contd.)

Component name, reading and nominal limits are shown on the display which in this example is for the crankshaft position sensor.

CRANKSHAFT POS. SENSOR 41
0.0 Hz ALARM
(1.0 – 7000.0 Hz)
ON/ENTER CONTINUES

Press **ON/ENTER** to return to the subsystem menu.

When a fault arises, a primary fault, the Test while driving stops. Rectify the fault in order for the Test while driving to continue a search for more faults.

BOB test

Testing using a breakout box makes it possible to test systems where neither of the alternatives for manual or automatic testing is programmed. For test readings, refer to the readings and control module connections section of the appropriate service manual.

Select BREAK-OUT (BOB).

Press **ON/ENTER**.

Press **ON/ENTER**.

Check the number of pins on the ECM in order to determine which wiring should be used.

Use **F3** and **F4** to browse in the menu.

Choose the wiring and press **ON/ENTER**.

It is now possible to select the pin to be tested. Enter the number and press **ON/ENTER**.

SELECT PIN
PIN NO: __
ON/ENTER CONTINUES

BOB test (contd.)

Select the correct units and press the appropriate function key.

Example

Select VOLTAGE and press F1.

You will be asked whether the selected pin can take a load. The following components must not be subjected to a load: Oxygen sensors, mass air flow sensor and MAP sensor.

These components may be damaged or produce an incorrect reading.

Engine operation may be affected.

Press F1 for yes.

Note

In this of test, the ISAT scan tool allows a weak current to flow through the selected pin number.

F1 = SEL allows you to select a further two pins for simultaneous readings.

F2 = DEL excludes the selected pin from the test.

Press F2 to exclude.

F1 = for Yes to exclude.

F2 = for No which saves.

Press ESC to get to the main menu.

Press F4 to close down the system.

SELECT MEASUREMENT

F1 = VOLTAGE

F2 = FREQUENCY

F3 = TIME/DUTY CYCLE

LOAD SIGNAL ?

YES NO

PIN 13 0.4V

Upgrading, PC to ISAT scan tool	126	Memory module, changing	130
Upgrading, ISAT scan tool to ISAT scan tool	127	Adjusting display	131
Changing the battery	128		

Upgrading, PC to ISAT scan tool

D101W-9352

In order to upgrade the ISAT scan tool, the instrument must be equipped with the M96 memory module. Check by switching on the ISAT scan tool. The display should show **version 6.0 or higher**. If it is a lower version, a new memory module should be ordered.

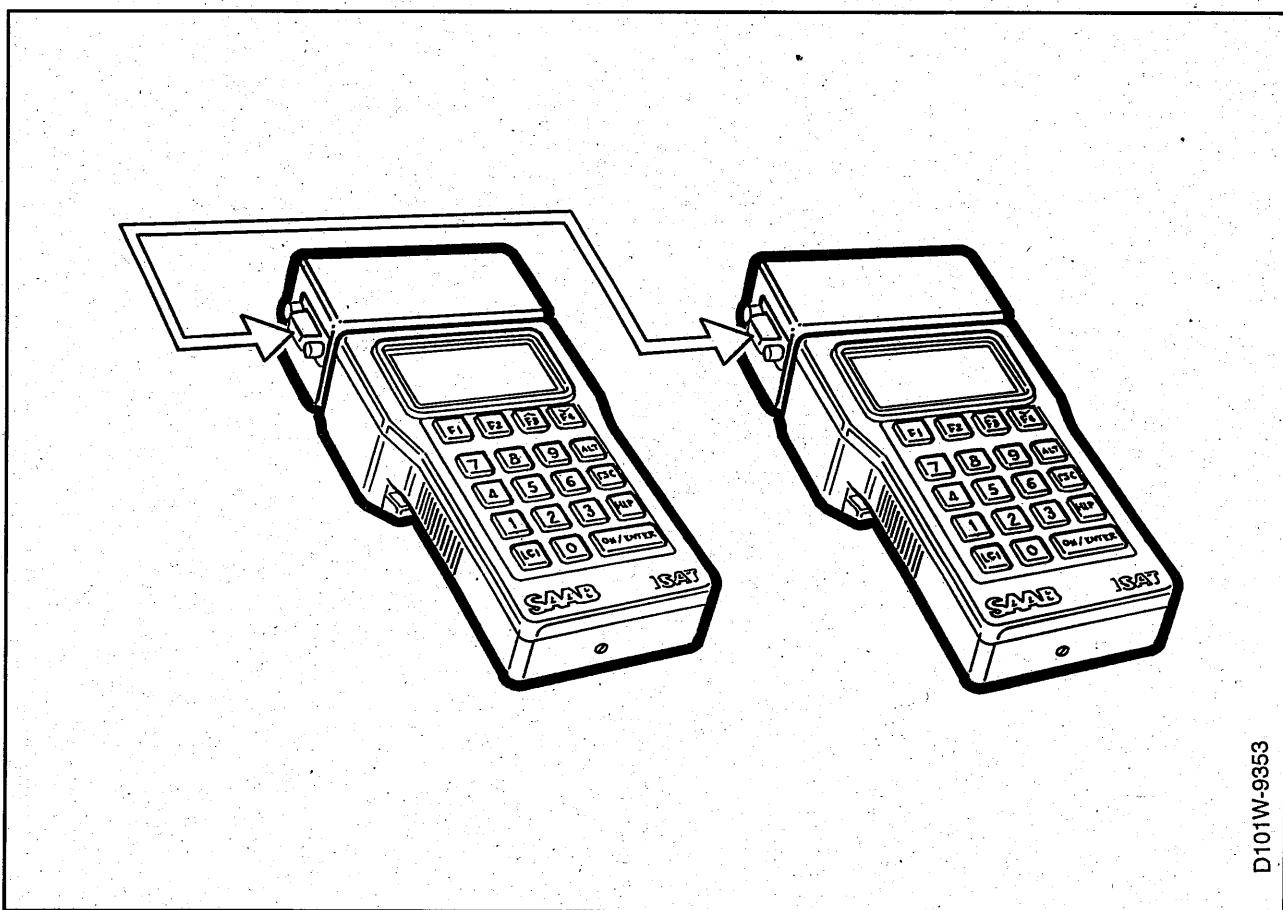

Upgrading with PC (personal computer)

The computer must be IBM compatible and equipped with DOS and preferably also with Windows™.

- 1 Connect the null modem cable with the 9-pin connector to the computer's communications port (see the computer manual). Connect the other end to the SDA module COMM 9 socket.
- 2 Start Windows™ and activate the window with the FLASH PROGRAMMING icon.
- 3 Double click on the icon and click once on FILE and then on CONFIGURE. Select the communications port that the ISAT scan tool is connected to.

- 4 Click on OK and then RESTART. The text CONNECT AND ACTIVATE ISAT is displayed.
- 5 Switch on the ISAT scan tool and select UPDATE ISAT and press F2 for RECEIVER ← ISAT.
- 6 If the coupling is faulty, you will see a message advising you to check the connection and restart.
- 7 When the upgrade starts, this can be seen on both displays.
- 8 During the upgrade, the display shows which version is currently being fed in, the number of banks 1–32 and the number of blocks 198–0. A timer counts down from 100 to 0.
- 9 If the upgrade is approved, this is shown on the display.
- 10 If the upgrade is not approved you will have the option of restarting.

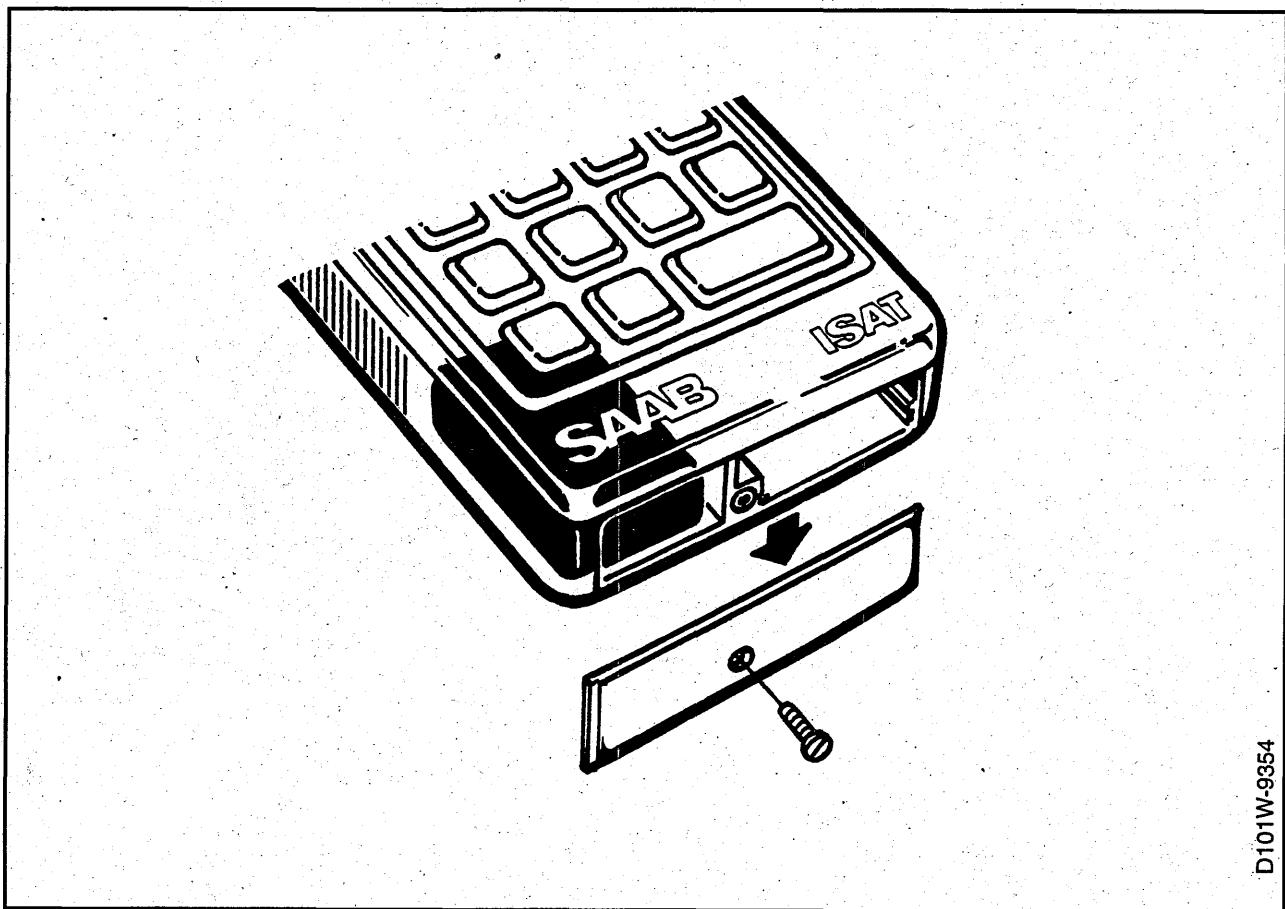

Upgrading, ISAT scan tool to ISAT scan tool

It is also possible to upgrade the ISAT scan tool using a second ISAT scan tool (primary ISAT scan tool) which has been upgraded using a PC. The upgrade takes about 60 minutes so the ISAT scan tool should be connected to a car to receive operating current.

- 1 Connect the null modem cable with the 9-pin connector to the SDA module's COMM 9 socket.
- 2 Primary ISAT scan tool:
Switch on the ISAT scan tool and select UPDATE ISAT and press **F3** for SEND → ISAT
- 3 Slave ISAT:
Switch on the ISAT scan tool and select UPDATE ISAT and press **F2** for RECEIVER ← ISAT.
- 4 If the coupling is faulty, you will see a message advising you to check the connection and restart.
- 5 When the upgrade starts, this can be seen on both displays.
- 6 During the upgrade, the display shows which version is currently being fed in, the number of banks 1–32 and the number of blocks 198–0. A timer counts down from 100 to 0.
- 7 If the upgrade is approved, this is shown on the display.
- 8 If the upgrade is not approved you will have the option of restarting.

Changing the battery

D101W-9354

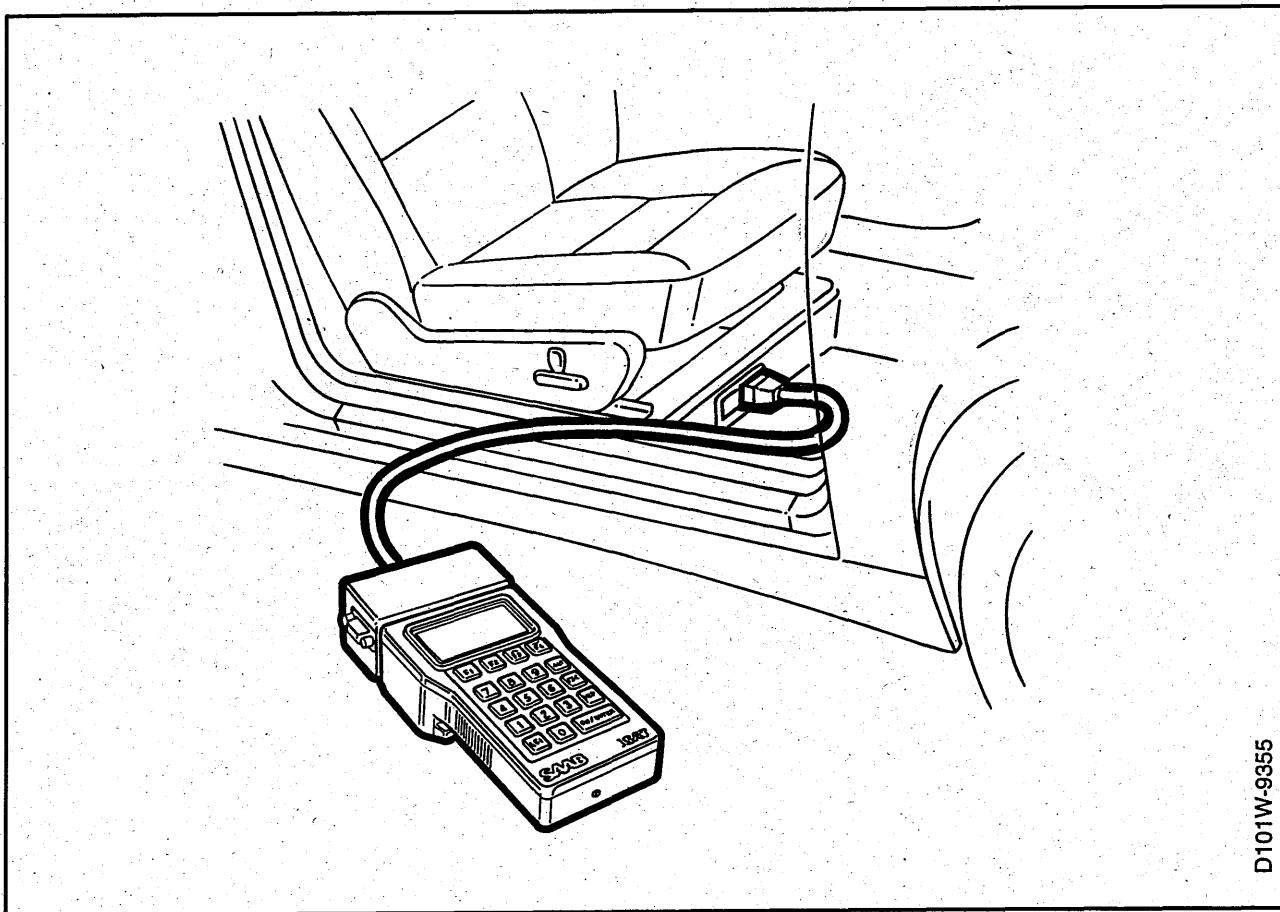

There is a battery in the bottom of the ISAT scan tool.
This battery is changed as follows:

- 1 Remove the cover.
- 2 Remove the battery and unplug the connector.
- 3 Connect the new battery and push it into position,
refitting the cover.

⚠ WARNING

Only use a recommended **9 V rechargeable** battery. If other batteries are used, there is a danger of the ISAT scan tool exploding when it is connected to a car.

Charging the battery

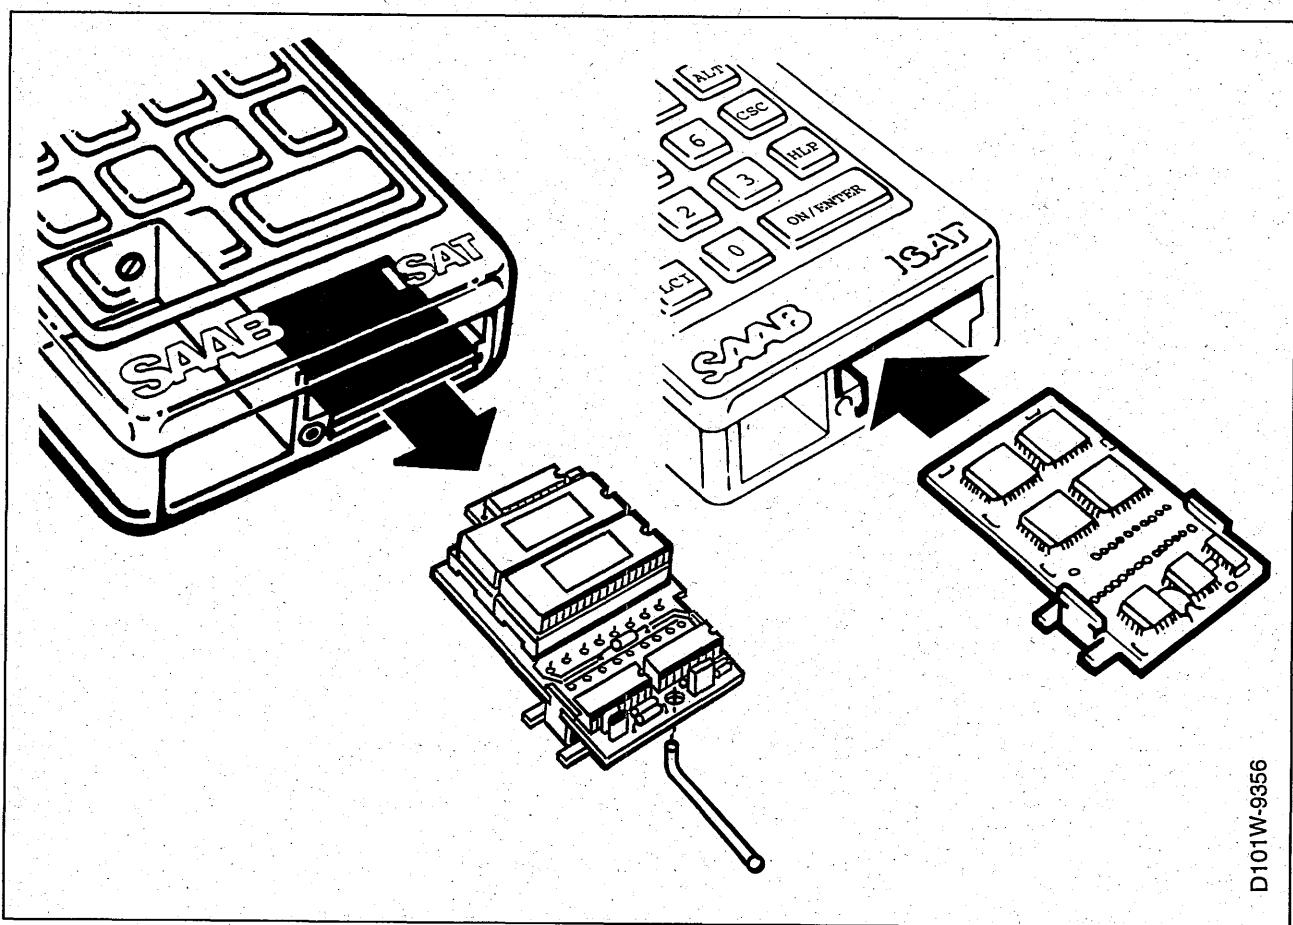

D101W-9355

In order for the battery in the ISAT scan tool to continue working for a long time, it must be recharged. Charging takes place when the ISAT scan tool is connected to a car via the data link connector. In order for the battery to become fully charged, the ISAT scan tool must be:

Connected for about 14 hours.

Memory module, changing

In order for the ISAT scan tool to be upgraded in the future, it must be equipped with the M96 memory module.

This module is located behind the cover in the bottom of the ISAT scan tool.

The module is changed as follows:

- 1 Remove the cover on the bottom of the ISAT scan tool.
- 2 Extract the memory module using the hole in the outer edge.
- 3 Carefully insert the new module and refit the cover.

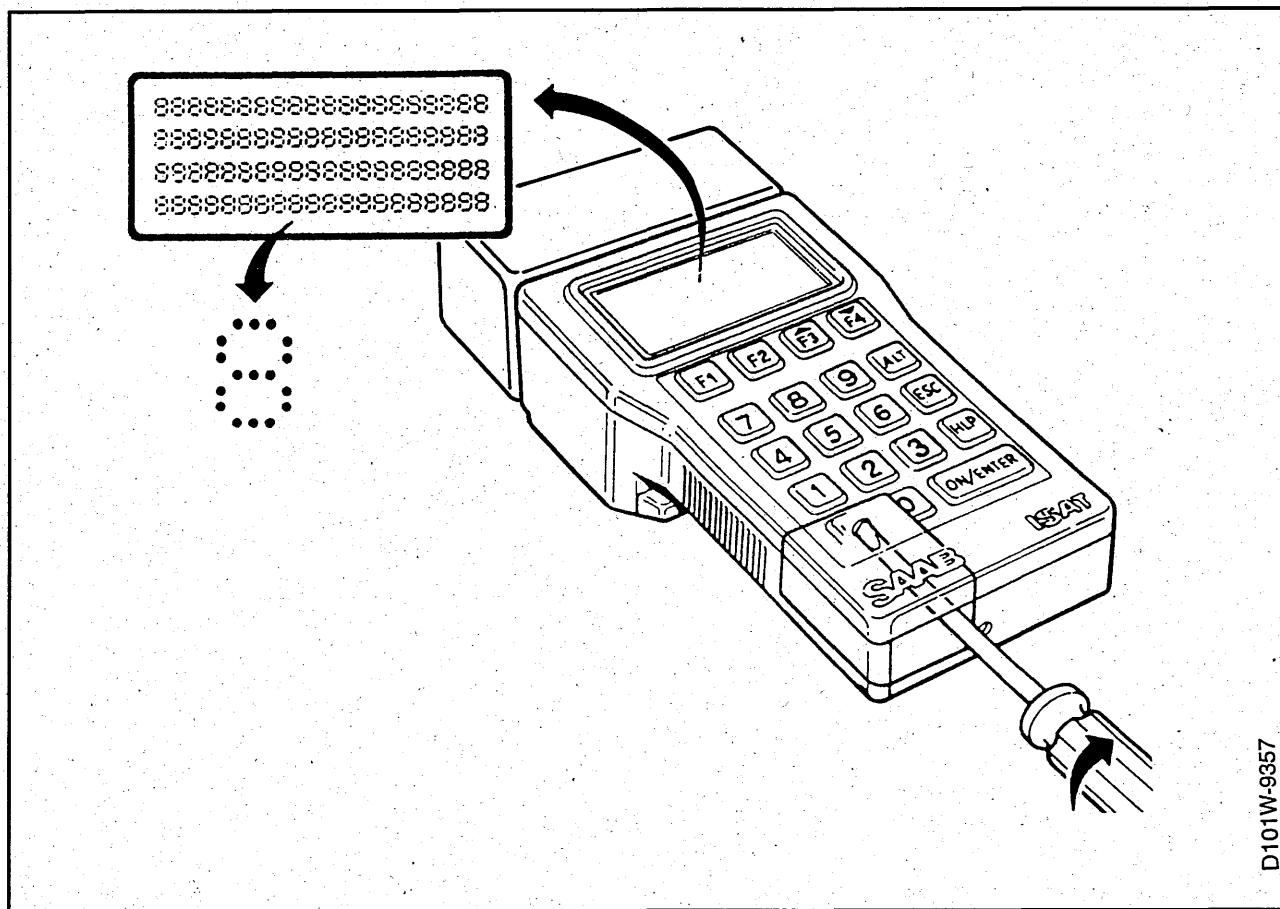

Important

Take care when handling the memory module. The memory module circuits are extremely sensitive to electrostatic discharge and can, if handled incorrectly, be damaged so severely as to be rendered unserviceable.

Never touch the memory module circuits and never place the module where it can come into contact with foreign objects.

Always store loose memory modules in an ESD cover.

Adjusting display

The display view angle can only be adjusted on the ISAT I scan tool.

The display is a dot matrix LCD display. This display is not as easy to read from all angles due to the properties of the LCD. It is therefore possible to adjust the angle using a set screw inside the battery cover. In the ISAT II scan tool, the display is manufactured in such a manner that it is easy to read from all angles.

- 1 Unscrew the battery cover on the bottom of the ISAT scan tool.
- 2 Remove the battery without disconnecting the leads.
- 3 Look at the display while carefully turning the set screw as illustrated. When the display is easy to read from the angle you require, release the set screw and close the cover.

Comments/suggestions

Manual concerned:

It is important that Saab technicians in the field regard the Workshop Service Manual as their bible, and we therefore strive to make the manual easy to use and to provide accurate information.

By letting us have your views on this manual you will be helping us to maintain a high standard in our literature.

Note down any comments or suggestions you may have on a sheet of paper or take a copy of this page and send us your views at the above address. For greater convenience, you are also welcome to send your comments by fax, using the telephone number shown.
